GPMI_VERSION field descriptions

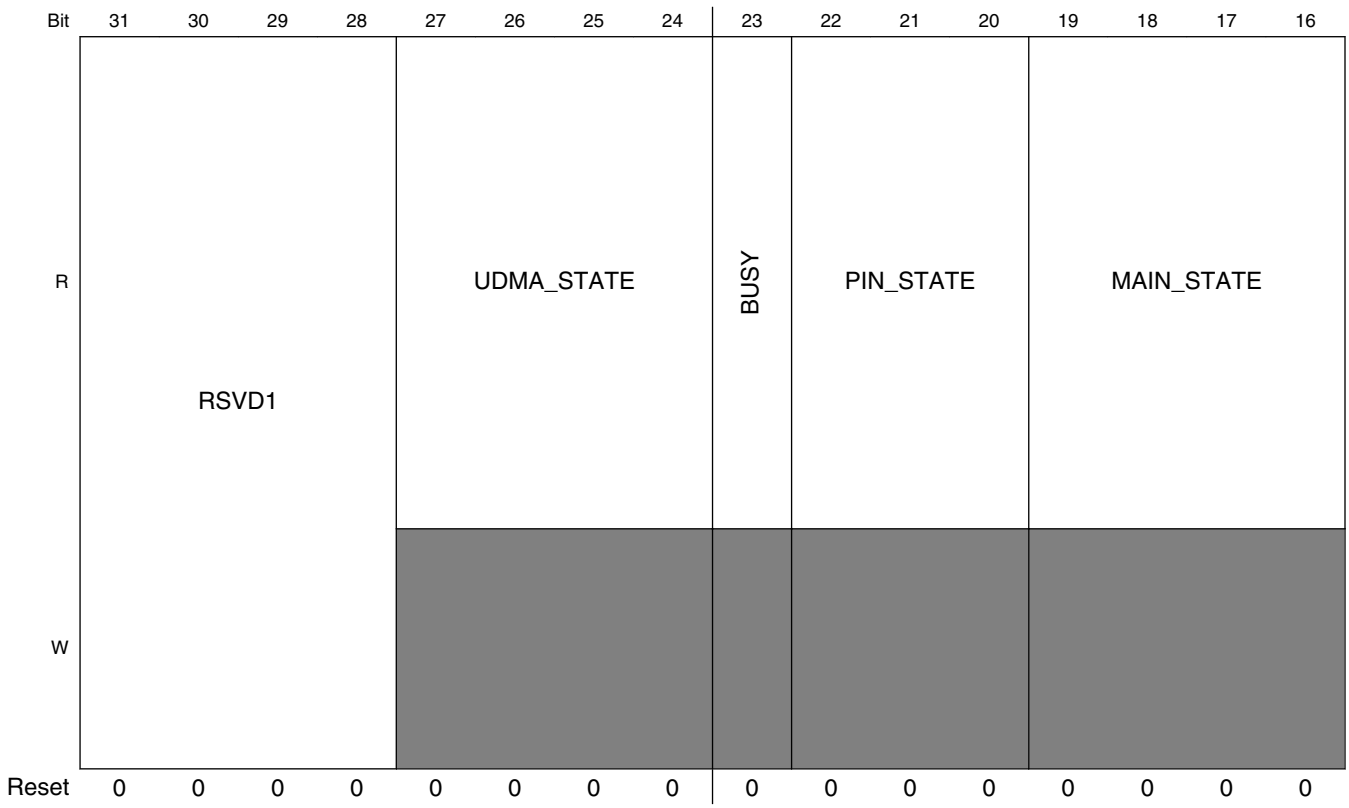
Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

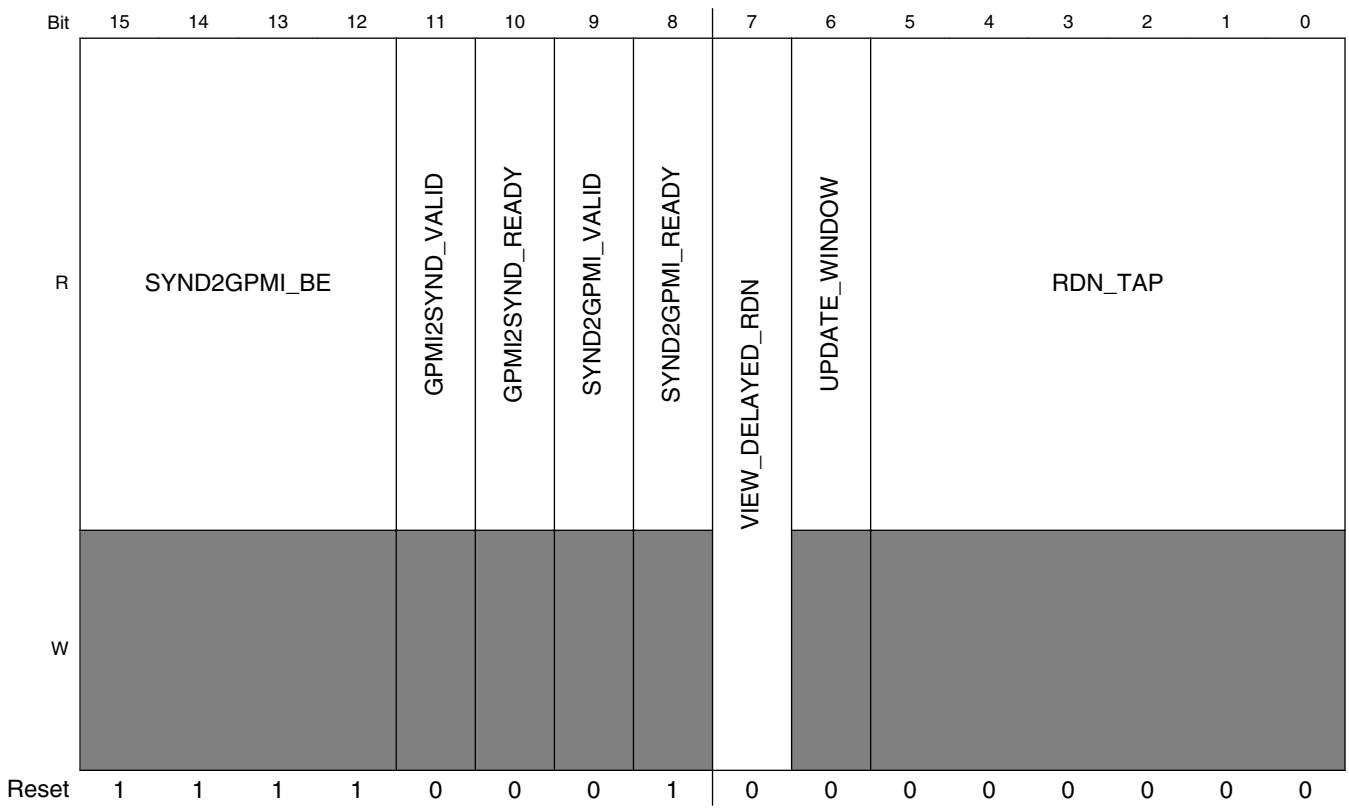
29.6.15 GPMI Debug2 Information Register Description (GPMI_DEBUG2)

The GPMI Debug2 information register provides a read back path for diagnostics to determine the current operating state of the GPMI controller.

GPMI_DEBUG2 0x0E0

Address: 11_2000h base + E0h offset = 11_20E0h





GPMI_DEBUG2 field descriptions

Field	Description
31–28 RSVD1	Always write zeroes to this bit field.
27–24 UDMA_STATE	USM_IDLE = 4'h0, idle USM_DMARQ = 4'h1, DMA req USM_ACK = 4'h2, DMA ACK USM_FIFO_E = 4'h3, Fifo empty USM_WPAUSE = 4'h4, WR DMA Paused by device USM_TSTRB = 4'h5, Toggle HSTROBE USM_CAPTUR = 4'h6, Capture Stage, (data sampled with DSTROBE is valid) USM_DATOUT = 4'h7, Change Burst DATAOUT USM_CRC = 4'h8, Source CRC to Device USM_WAIT_R = 4'h9, Waiting for DDMARDY- USM_END = 4'ha; Negate DMAACK (end of DMA) USM_WAIT_S = 4'hb, Waiting for DSTROBE USM_RPAUSE = 4'hc, Rd DMA Paused by Host USM_RSTOP = 4'hd, Rd DMA Stopped by Host USM_WTERM = 4'he, Wr DMA Termination State USM_RTERM = 4'hf, Rd DMA Termination state
23 BUSY	When asserted the GPMI is busy. Undefined results may occur if any registers are written when BUSY is asserted. DISABLED = 0x0 The GPMI is not busy. ENABLED = 0x1 The GPMI is busy.
22–20 PIN_STATE	parameter PSM_IDLE = 3'h0, PSM_BYTCNT = 3'h1, PSM_ADDR = 3'h2, PSM_STALL = 3'h3, PSM_STROBE = 3'h4, PSM_ATARDY = 3'h5, PSM_DHOLD = 3'h6, PSM_DONE = 3'h7. PSM_IDLE = 0x0 PSM_BYTCNT = 0x1 PSM_ADDR = 0x2 PSM_STALL = 0x3 PSM_STROBE = 0x4 PSM_ATARDY = 0x5 PSM_DHOLD = 0x6 PSM_DONE = 0x7

GPMI_READ_DDR_DLL_CTRL field descriptions

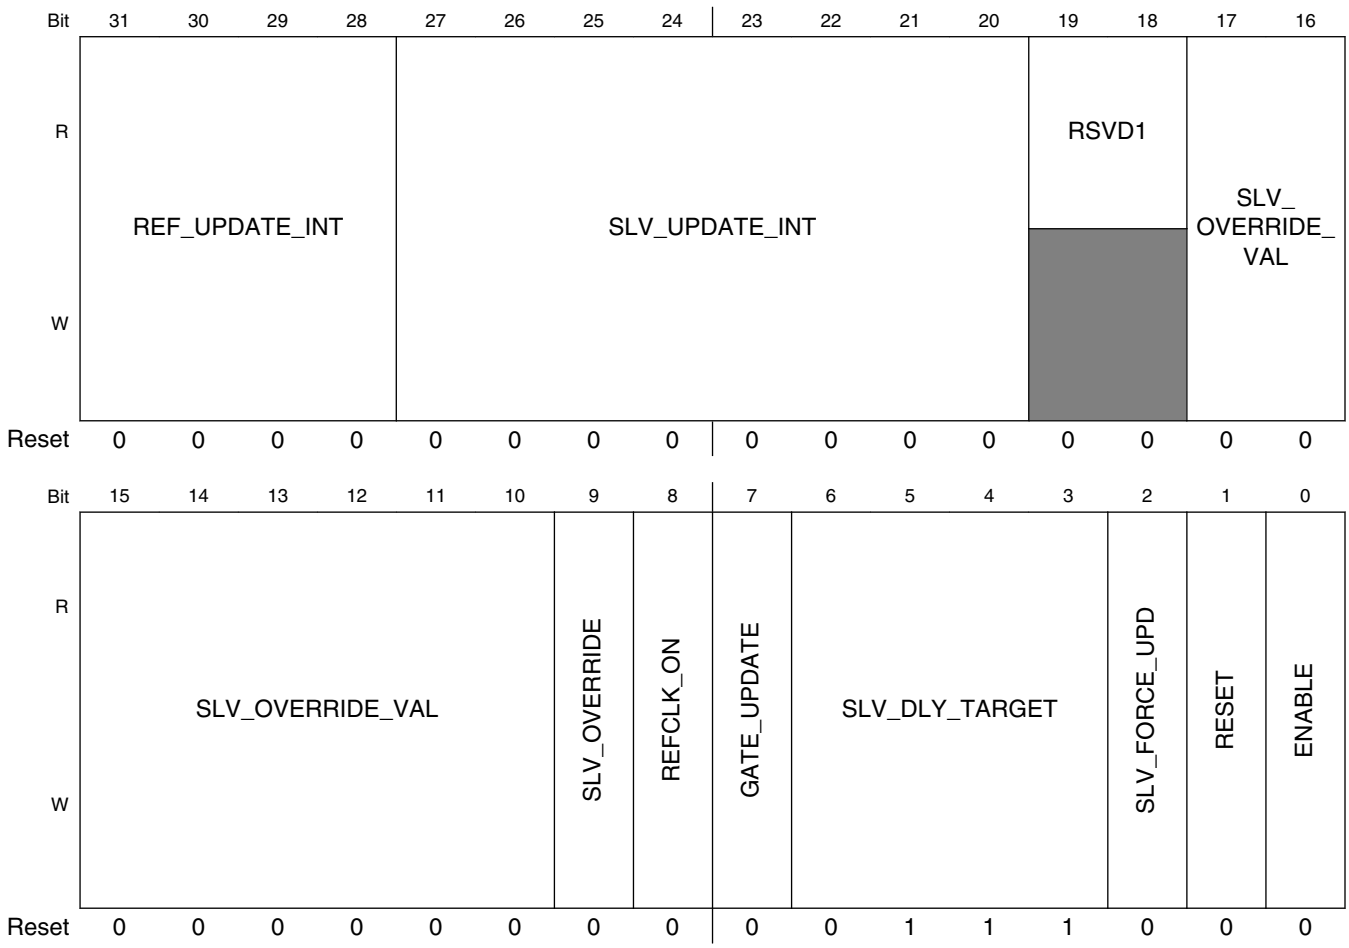
Field	Description
31–28 REF_UPDATE_INT	This field allows the user to add additional delay cycles to the DLL control loop (reference delay line control). By default, the DLL control loop shall update every two GPMICLK cycles. Programming this field results in a DLL control loop update interval of (2 + REF_UPDATE_INT) * GPMICLK. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–20 SLV_UPDATE_INT	Setting a value greater than 0 in this field, shall over-ride the default slave delay-line update interval of 256 GPMICLK cycles. A value of 0 results in an update interval of 256 GPMICLK cycles (default setting). A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
19–18 RSVD1	Reserved
17–10 SLV_OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 256 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 256.
9 SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to tbe enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0
8 REFCLK_ON	set this bit to 1 will turn on the reference clock
7 GATE_UPDATE	Setting this bit to 1, forces the slave delay line not update
6–3 SLV_DLY_TARGET	The delay target for the read clock is can be programmed in 1/16th increments of an GPMICLK half-period. So the input read-clock can be delayed relative input data from (GPMICLK/2)/16 to GPMICLK/2.
2 SLV_FORCE_UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered).
1 RESET	Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-calibrate to detect an GPMICLK half period phase shift. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again.
0 ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE VAL, the DLL does not need to be enabled.

29.6.18 GPMI Double Rate Write DLL Control Register Description (GPMI_WRITE_DDR_DLL_CTRL)

GPMI DDR Write Delay Loop Lock Control Register. This register provides programmability in DDR mode for data output timing and data formats.

GPMI_WRITE_DDR_DLL_CTRL 0x110

Address: 11_2000h base + 110h offset = 11_2110h



GPMI_WRITE_DDR_DLL_CTRL field descriptions

Field	Description
31–28 REF_UPDATE_ INT	This field allows the user to add additional delay cycles to the DLL control loop (reference delay line control). By default, the DLL control loop shall update every two GPMICLK cycles. Programming this field results in a DLL control loop update interval of (2 + REF_UPDATE_INT) * GPMICLK. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–20 SLV_UPDATE_ INT	Setting a value greater than 0 in this field, shall over-ride the default slave delay-line update interval of 256 GPMICLK cycles. A value of 0 results in an update interval of 256 GPMICLK cycles (default setting). A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
19–18 RSVD1	Reserved
17–10 SLV_ OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 256 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 256.
9 SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to tbe enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0

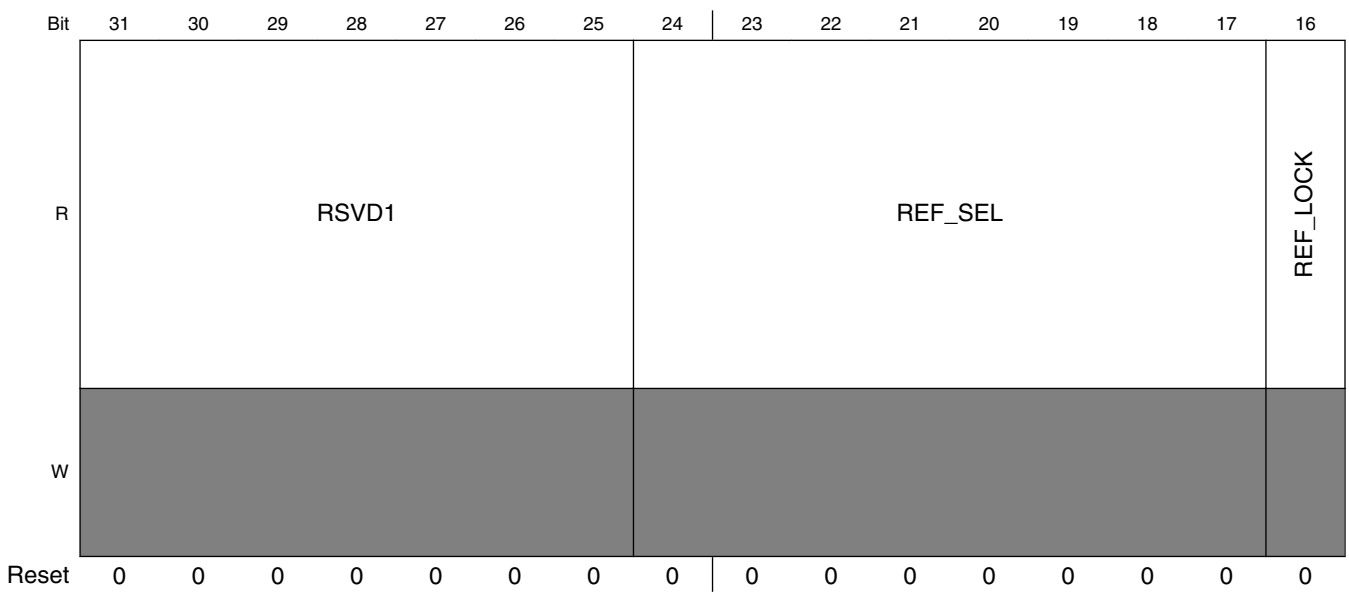
6–3 SLV_DLY_ TARGET	The delay target for the read clock can be programmed in 1/16th increments of an GPMICLK half-period. So the input read-clock can be delayed relative input data from (GPMICLK/2)/16 to GPMICLK/2.
2 SLV_FORCE_ UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered).
1 RESET	Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-calibrate to detect an GPMICLK half period phase shift. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again.
0 ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE VAL, the DLL does not need to be enabled.

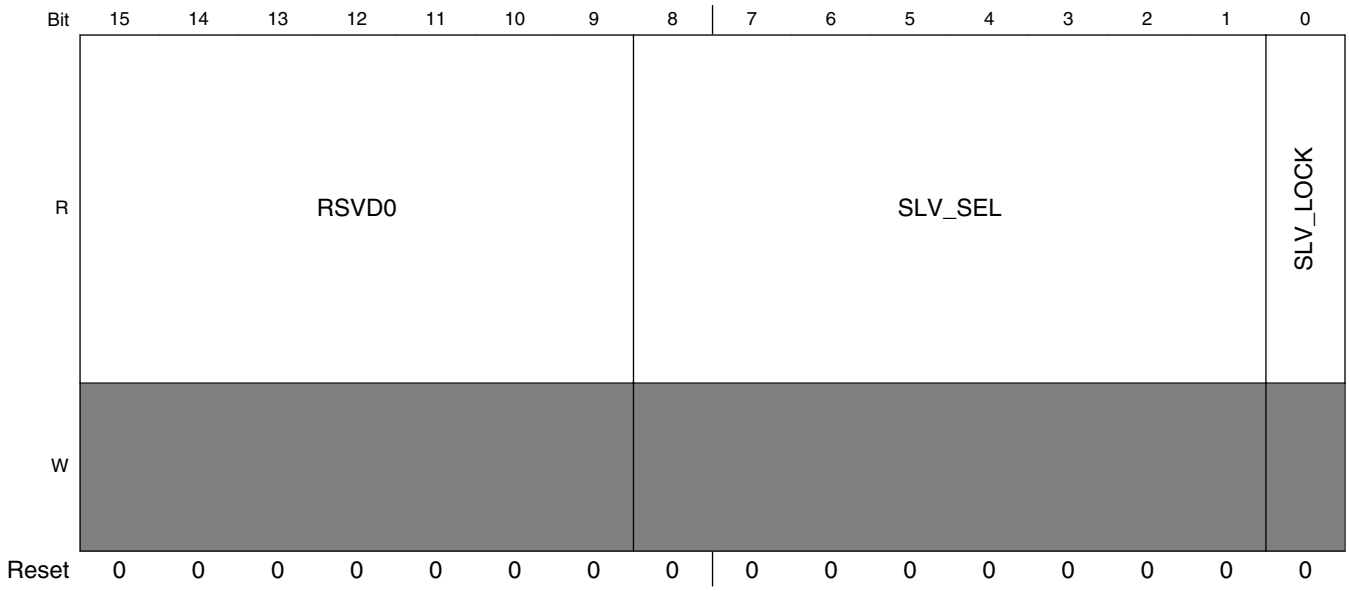
29.6.19 GPMI Double Rate Read DLL Status Register Description (GPMI_READ_DDR_DLL_STS)

GPMI Double Rate Read DLL Status Register, Read Only. GPMI DLL status fields are provided in this register.

GPMI_READ_DDR_DLL_STS 0x120

Address: 11_2000h base + 120h offset = 11_2120h





GPMI_READ_DDR_DLL_STS field descriptions

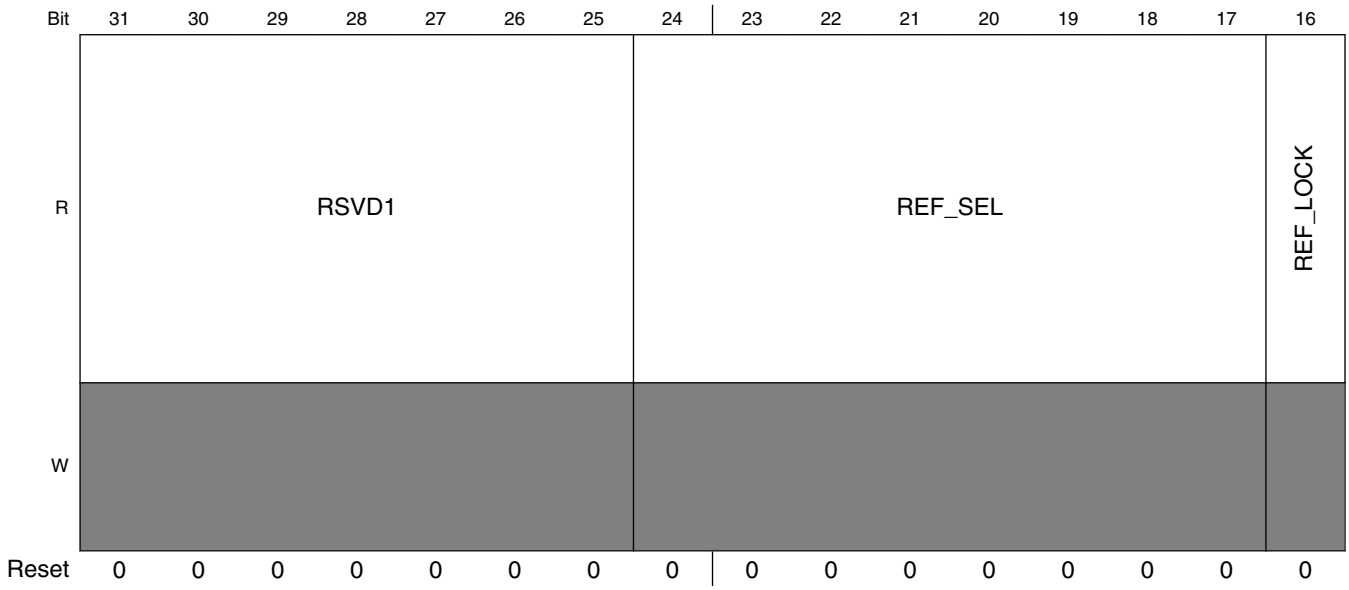
Field	Description
31–25 RSVD1	Reserved
24–17 REF_SEL	Reference delay line select status.
16 REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to a half-phase GPMICLK shift, allowing the slave delay-line to perform programmed clock delays.
15–9 RSVD0	Reserved
8–1 SLV_SEL	Slave delay line select status
0 SLV_LOCK	Slave delay-line lock status. This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value.

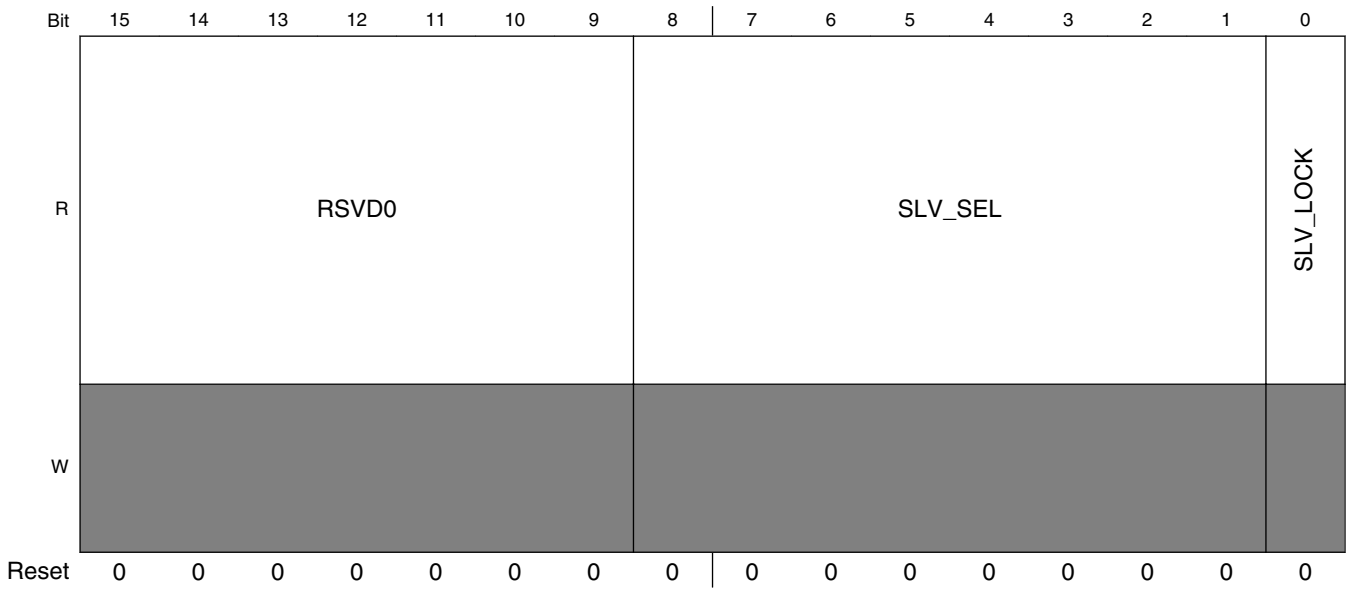
29.6.20 GPMI Double Rate Write DLL Status Register Description (GPMI_WRITE_DDR_DLL_STS)

GPMI Double Rate Write DLL Status Register, Read Only. GPMI DLL status fields are provided in this register.

GPMI_WRITE_DDR_DLL_STS 0x130

Address: 11_2000h base + 130h offset = 11_2130h





GPMI_WRITE_DDR_DLL_STS field descriptions

Field	Description
31–25 RSVD1	Reserved
24–17 REF_SEL	Reference delay line select status.
16 REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to a half-phase GPMICLK shift, allowing the slave delay-line to perform programmed clock delays.
15–9 RSVD0	Reserved
8–1 SLV_SEL	Slave delay line select status

Table continues on the next page...

GPMI_WRITE_DDR_DLL_STS field descriptions (continued)

Field	Description
0 SLV_LOCK	Slave delay-line lock status. This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value.

Chapter 30
General Purpose Timer (GPT)

30.1 Overview

This chapter describes the General Purpose Timer (GPT) module interface. It is also a reference for software driver programming.

The GPT has a 32-bit up-counter. The timer counter value can be captured in a register using an event on an external pin. The capture trigger can be programmed to be a rising or/and falling edge. The GPT can also generate an event on the DO_CMPOUT*n* pins and an interrupt when the timer reaches a programmed value. The GPT has a 12-bit prescaler, which provides a programmable clock frequency derived from multiple clock sources.

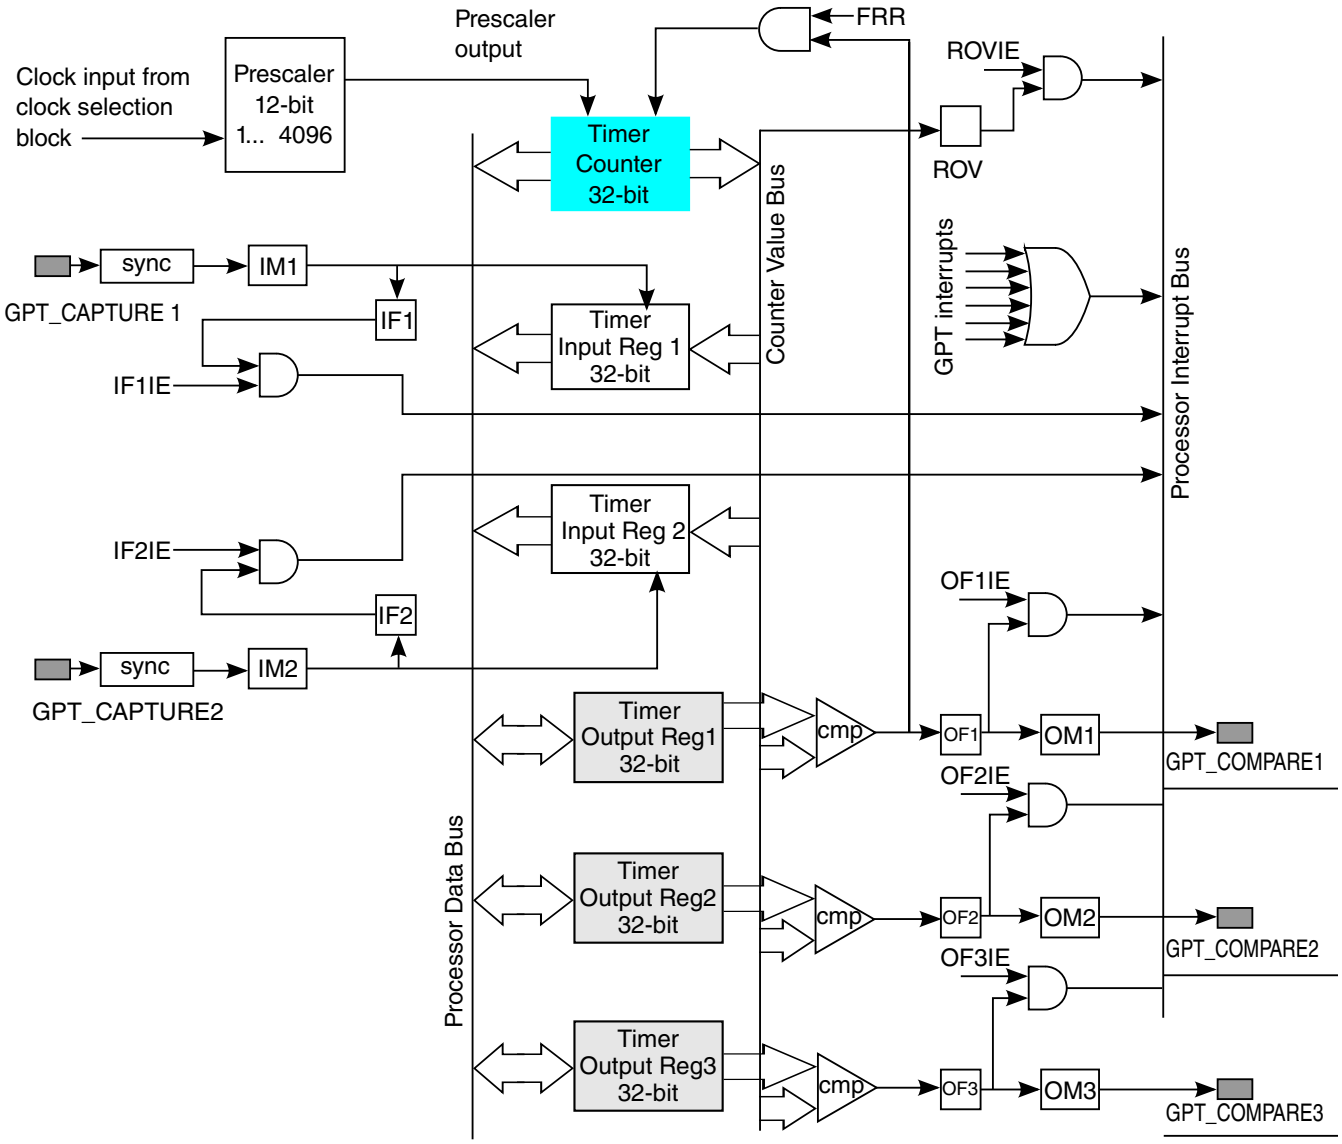


Figure 30-1. GPT Block Diagram

The following figure shows the GPT functional clocking scheme.

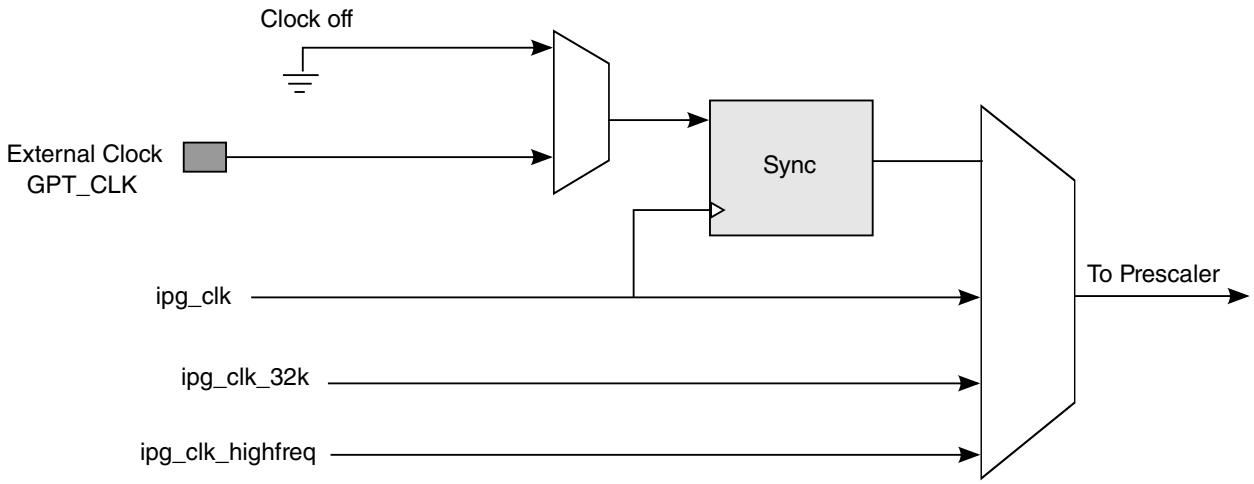

Figure 30-2. GPT Counter Clocks Diagram

30.1.1 Features

- One 32-bit up-counter with clock source selection, including external clock.
- Two input capture channels with a programmable trigger edge.
- Three output compare channels with a programmable output mode. A "forced compare" feature is also available.
- Can be programmed to be *active* in low power and debug modes.
- Interrupt generation at capture, compare, and rollover events.
- Restart or free-run modes for counter operations.

30.1.2 Modes and Operation

The GPT supports the modes described in the indicated sections:

- Operating Modes
  - Restart Mode
  - Free-Run Mode

30.2 External Signals

The GPT follows the IP Bus protocol for interfacing with the processor core. The GPT does not have *any interface signals with any other module inside the chip,* except for the clock and reset inputs (from the clock and reset controller module) and for the interrupt signals *to* the processor interrupt handler. There are functional and clock inputs, and functional output signals going outside the chip boundary.

The following table describes all block signals that connect off-chip.

Table 30-1. GPT External Signals

Signal	Description	Pad	Mode	Direction
GPT_CLK	Input pin for an external clock that the counter can be operated at.	SD1_CLK	ALT3	I
GPT_CAPTURE1	Input pin for a capture event for Input Capture Channel 1.	SD1_DAT0	ALT3	I
GPT_CAPTURE2	Input pin for a capture event for Input Capture Channel 2.	SD1_DAT1	ALT3	I
GPT_COMPARE1	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1.	SD1_CMD	ALT3	O
GPT_COMPARE2	Output pin that indicates a "compare event" occurrence in Output Compare Channel 2.	SD1_DAT2	ALT2	O
GPT_COMPARE3	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3.	SD1_DAT3	ALT2	O

There are six signals (three input, three output) in the GPT module that *can be* connected to the chip pads.

30.2.1 External Clock Input

The GPT counter can be operated using an external clock from outside the device, and this is the input pin used for that purpose.

The external clock input GPT_CLK is treated as asynchronous to the peripheral clock. To ensure proper operations of GPT, the external clock input frequency should be less than 1/4 of frequency of the peripheral clock. Hysteresis characteristics on this pad will be required because this is a clock input.

30.2.2 Input Capture Trigger Signals

The GPT counter value can be stored in a register, triggered by an event from *outside the device*.

A positive or/and negative edge on these signals GPT_CAPTURE1 , GPT_CAPTURE2 can trigger this capture event. These signals are treated as asynchronous to the peripheral clock. Only those transitions which occur *at least a single clock cycle* (the clock selected to run the counter) *after the previous recorded transition* are guaranteed to trigger a capture event.

30.2.3 Output Compare Signals

The output compare signals: GPT_COMPARE1, GPT_COMPARE2, GPT_COMPARE3, indicate that output compare events have gone through a specified transition.

30.3 Clocks

The clock that is input to the prescaler can be selected from 4 clock sources:

The following table describes the clock sources for GPT. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 30-2. GPT Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- High-Frequency Clock (ipg_clk_highfreq)

  Provided by the Clock Controller Module (CCM), the High Frequency Clock is intended to be ON in Normal Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the High Frequency Clock *in Normal Power mode*. The CCM is expected to provide this clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the High Frequency Clock in a Low Power mode.

- Low-Reference Clock (ipg_clk_32k)

  This 32 kHz Low Reference Clock (provided by the CCM) is intended to be ON in Low Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the Low Reference Clock in Low Power mode. The CCM is expected to provide the Low Reference Clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the Low Reference Clock in a Low Power mode.

- Peripheral Clock (ipg_clk)

  If the Peripheral Clock or the External Clock is selected(CLKSRC=001 or 011) as Clock Source, then the Peripheral Clock will be ON in normal GPT operations. In Low Power modes, if the GPT is programmed to be disabled (STOPEN or WAITEN or DOZEN=0), then the Peripheral Clock can be switched OFF.

- External Clock

  The External Clock comes from *outside the device* and can be selected to run the GPT counter. The External Clock is treated as *asynchronous to the Peripheral Clock,* and is synchronized to the Peripheral Clock, *inside* the module. Therefore, the External Clock frequency is limited to < 1/4 frequency of the Peripheral Clock, for proper GPT operations. Note that in Low Power modes, *if* the Peripheral Clock is not available, then the External Clock *cannot be used* to run the counter.

- Crystal Oscillator Clock

  This 24MHz Crystal Oscillator Clock (provided by the CCM) is intended to be used against frequency change of Peripheral Clock changes to provide a more accurate timer clock for operation system. The CCM is expected to provide the 24MHz Crystal Oscillator Clock *without* synchronizing it to the System Bus Clock in Normal functional mode. Synchronization is done in GPT module. Before synchronization, the 24MHz Crystal Oscillator Clock is divided by a 24MHz clock prescaler, to make sure the clock frequency less than half of System Bus Clock .

The clock input source is configured using the clock source field (CLKSRC, in the GPT_CR control register). The clock input to the prescaler can be disabled by programming the CLKSRC bits (of the GPT_CR control register) to 000. **The CLKSRC field value should be changed** *only after disabling the GPT* (by setting the EN bit in the GPT_CR to 0).

The PRESCALER field selects the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value (from 1 to 4096) and can be changed *at any time*. A change in the value of the PRESCALER field *immediately affects* the output clock frequency.

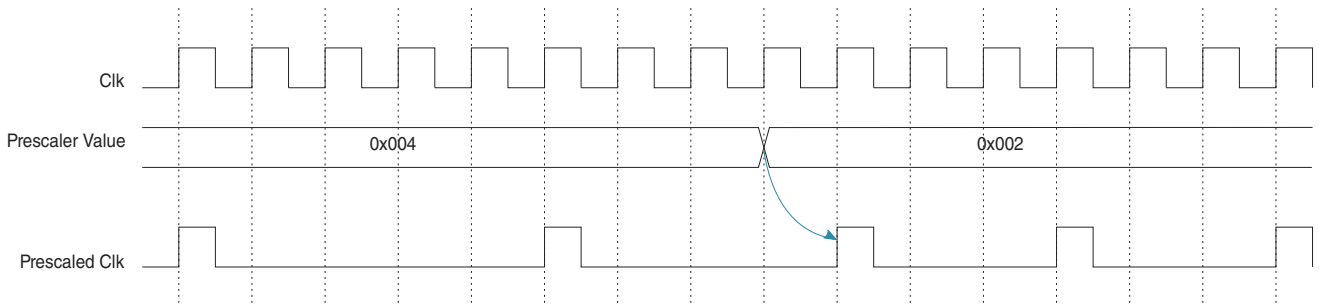

Figure 30-3. Prescaler Value Change Timing Diagram

30.4 Functional Description

This section provides a complete functional description of the GPT.

30.4.1 Operating Modes

The GPT counter can be programmed to work in either of two modes: Restart mode or Free-Run mode.

30.4.1.1 Restart Mode

In Restart mode (selectable through the GPT Control Register GPT_CR), when the counter reaches the compared value, the counter resets and starts again from 0x00000000. The Restart feature is associated only with Compare Channel 1.

Any write access to the Compare register of Channel 1 will reset the GPT counter. This is done to avoid possibly missing a compare event when compare value is changed from a higher value to lower value while counting is proceeding.

For the other two compare channels, when the compare event occurs the counter is *not reset*.

30.4.1.2 Free-Run Mode

In Free-Run mode, when compare events occur for all 3 channels, the counter is *not reset*; instead the counter continues to count until 0xffffffff, and then rolls over (to 0x00000000).

30.4.2 Operation

The General Purpose Timer (GPT) has a single counter (GPT_CNT) that is a 32-bit free-running *up-counter,* which starts counting *after it is enabled by software* (EN=1).

The counter's clock source is the output of the prescaler labelled "Prescaler output" in Figure 30-1.

- If the GPT timer is disabled (EN=0), then the Main Counter *and* Prescaler Counter freeze their current count values. The ENMOD bit determines the value of the GPT counter when the EN bit is set and the Counter is enabled again.
  - If the ENMOD bit is set (=1), then the Main Counter and Prescaler Counter values are reset to 0, when GPT is enabled (EN=1).
  - If ENMOD bit is programmed to 0, then the Main Counter and Prescaler Counter restart counting from their frozen values, when GPT is enabled again (EN=1).
- If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter freeze at their current count values *when* GPT enters low power mode. When GPT exits a low power mode, the Main Counter and Prescaler Counter start counting from their frozen values *regardless* of the ENMOD bit value. Note that the GPT_CNT can be read *at any time* by the processor, and that *both* Input Capture Channels use the *same* counter (GPT_CNT).
- A hardware reset resets all the GPT registers to their respective reset values. All registers except the Output Compare Registers (OCR1, OCR2, OCR3) obtain a value of 0x0. The Compare registers are reset to 0xffffffff.
- The software reset (SWR bit in the GPT_CR control register) resets *all* of the register bits *except* the EN, ENMOD, STOPEN, WAITEN, and DBGEN bits. The state of these bits is not affected by a software reset. Note that a software reset can be given *while the GPT is disabled.*

30.4.2.1 Input Capture

There are two Input Capture Channels, and each Input Capture Channel has a dedicated capture pin, capture register and input edge detection/selection logic. Each input capture function has an associated status flag, and can cause the processor to make an interrupt service request.

When a selected edge transition occurs on an Input Capture pin, the contents of the GPT_CNT is captured on the corresponding capture register and the appropriate interrupt status flag is set. An interrupt request can be generated when the transition is detected *if* its corresponding enable bit is set (in the Interrupt Register). The capture can be programmed to occur on the input pin's rising edge, falling edge, on both rising and falling edges, or the capture can be disabled. The events are synchronized with the clock that was selected to run the counter. Only those transitions that occur at least one clock cycle (clock selected to run the counter) *after* the previous recorded transition will be guaranteed to trigger a capture event. There can be up to one clock cycle of uncertainty in the latching of the input transition. The Input Capture registers can be read *at any time* without affecting their values.

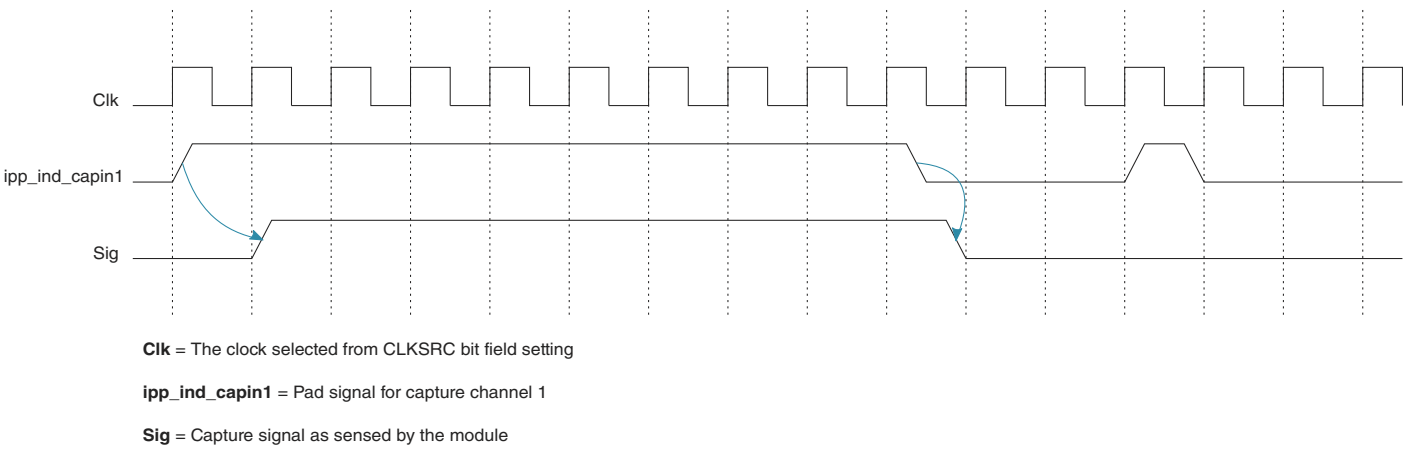

Figure 30-4. Input Capture Event Timing

30.4.2.2 Output Compare

The three Output Compare Channels *use the same counter* (GPT_CNT) as the Input Capture Channels. When the programmed content of an Output Compare register matches the value in GPT_CNT, an output compare status flag is set and an interrupt is generated (if the corresponding bit is set in the interrupt register). Consequently, the Output Compare timer pin will be set, cleared, toggled, not affected at all or provide an active-low pulse for one input clock period (subject to the restriction on the maximum frequency allowed on the pad) according to the mode bits (that were programmed).

There is also a "forced-compare" feature that allows the software to generate a compare event when required, *without the condition of the counter value that is equal to the compare value*. The action taken as a result of a forced compare is the same as when an output compare match occurs, *except that the status flags are not set and no interrupt can be generated*. Forced channels take programmed action immediately after the write to the force-compare bits. These bits are self-negating and always read as zeros.

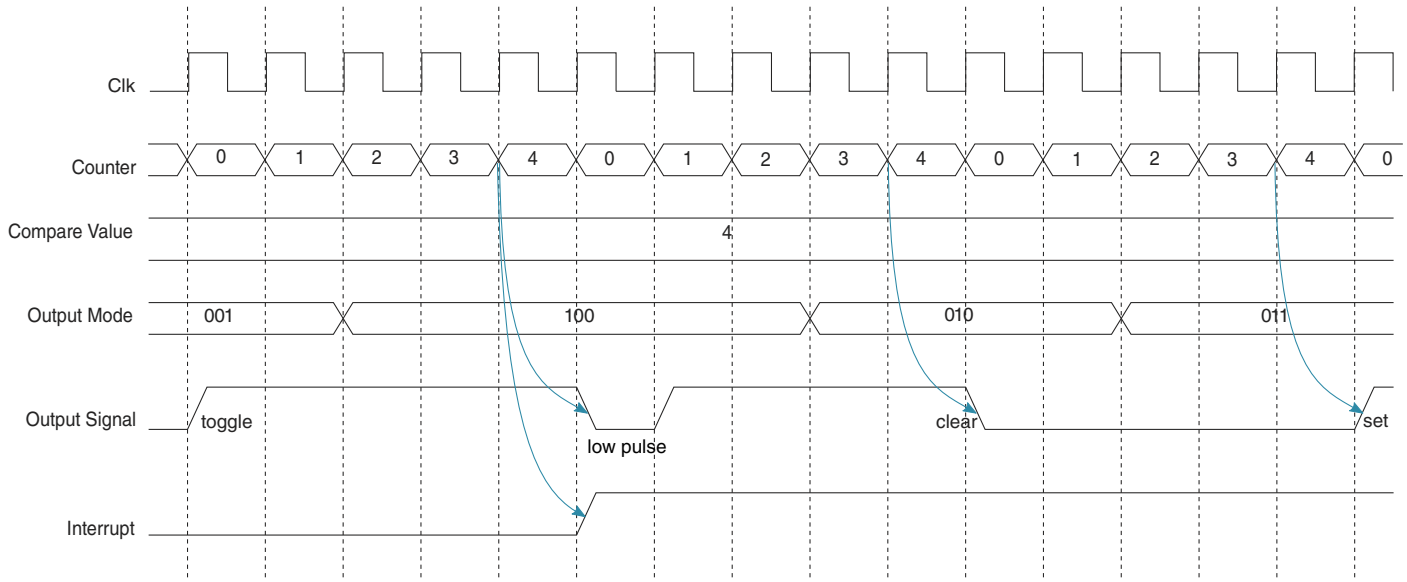

Figure 30-5. Output Compare and Interrupt Timing

30.4.2.3 Interrupts

There are 6 different interrupts that are generated by the GPT. If the selected clock for running the counter is available, then *all interrupts can be generated in Low Power and Debug modes*.

- Rollover Interrupt

  The Rollover Interrupt is generated when the GPT counter reaches 0xffffffff, then resets to 0x00000000 and continues counting. The Rollover Interrupt is enabled by the ROVIE bit in the GPT_IR register; the associated status bit is the ROV bit in the GPT_SR register.

- Input Capture Interrupt 1, 2

  After a capture event occurs, the associated Input Capture Channel generates an interrupt. The "capture event" interrupts are enabled by the IF2IE and IF1IE bits (in the GPT_IR register); the associated status bits are IF2 and IF1 (in the GPT_SR register). The capture of the counter value because of a capture event is *not affected by a pending capture interrupt*. The Capture register is updated with a new counter value when a capture event occurs, regardless of whether that Capture Channels' interrupt has been serviced or not.

- Output Compare Interrupt 1, 2, 3

After a compare event occurs, the associated Output Compare Channel generates an interrupt. The "compare event" interrupts are enabled by the OF3IE, OF2IE, and OF1IE bits (in the GPT_IR register); the associated status bits are OF3, OF2, and OF1 (in the GPT_SR register). A "forced compare" does not generate an interrupt.

A *cumulative* interrupt line is also present, which is asserted whenever any of the above interrupts are posted. The cumulative interrupt line has *no* associated enables or status bits.

30.4.2.4 Low Power Mode Behavior

In Low Power modes, if the clock from the selected clock source is available (except for the External Clock, which can be used *only if* the Peripheral Clock is available), the counter will continue to run depending on whether the control bit for that mode is set. If the clock is not present or if the corresponding low power bit in the GPT_CR control register is 0, the Main Counter and the Prescaler Counter freeze at their current values and resume counting (from their frozen values) when the Low Power mode is exited.

30.4.2.5 Debug Mode Behavior

In Debug mode, the modules in the device have the option of continuing to run or be halted.

- If the DBGEN bit is set, then the GPT timer will continue to run in Debug mode.
- If the DBGEN bit is not set (in the GPT_CR control register), then the GPT timer is halted.

30.5 Initialization/ Application Information

30.5.1 Selecting the Clock Source

The CLKSRC field in the GPT_CR register selects the clock source. The CLKSRC field value should be changed only after disabling the GPT (EN=0).

The software sequence to be followed while changing clock source is:

1. Disable GPT by setting EN=0 in GPT_CR register.
2. Disable GPT interrupt register (GPT_IR).

3. Configure Output Mode to unconnected/ disconnected—Write zeros in OM3, OM2, and OM1 in GPT_CR
4. Disable Input Capture Modes—Write zeros in IM1 and IM2 in GPT_CR
5. Change clock source CLKSRC to the desired value in GPT_CR register.
6. Assert the SWR bit in GPT_CR register.
7. Clear GPT status register (GPT_SR) (i.e., w1c).
8. Set ENMOD=1 in GPT_CR register, to bring GPT counter to 0x00000000.
9. Enable GPT (EN=1) in GPT_CR register.
10. Enable GPT interrupt register (GPT_IR).

30.6 GPT Memory Map/Register Definition

The GPT has 10 user-accessible 32-bit registers, which are used to configure, operate, and monitor the state of the GPT.

An IP bus write access to the GPT Control Register (GPT_CR) and the GPT Output Compare Register1 (GPT_OCR1) results in *one cycle of wait state*, while other valid IP bus accesses incur 0 wait states.

Irrespective of the Response Select signal value, a Write access to the GPT Status Registers (Read-only registers GPT_ICR1, GPT_ICR2, GPT_CNT) will generate a bus exception.

- If the Response Select signal is driven Low, then the Read/Write access to the *unimplemented* address space of GPT (*ips_addr* is greater than or equal to $BASE + $028) will generate a bus exception.
- If the Response Select is driven High, then the Read/Write access to the unimplemented address space of GPT will *not* generate any error response (like a bus exception).

GPT memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
209_8000	GPT Control Register (GPT_CR)	32	R/W	0000_0000h	30.6.1/1499
209_8004	GPT Prescaler Register (GPT_PR)	32	R/W	0000_0000h	30.6.2/1503
209_8008	GPT Status Register (GPT_SR)	32	R/W	0000_0000h	30.6.3/1504
209_800C	GPT Interrupt Register (GPT_IR)	32	R/W	0000_0000h	30.6.4/1505
209_8010	GPT Output Compare Register 1 (GPT_OCR1)	32	R/W	FFFF_FFFFh	30.6.5/1506
209_8014	GPT Output Compare Register 2 (GPT_OCR2)	32	R/W	FFFF_FFFFh	30.6.6/1507

Table continues on the next page...

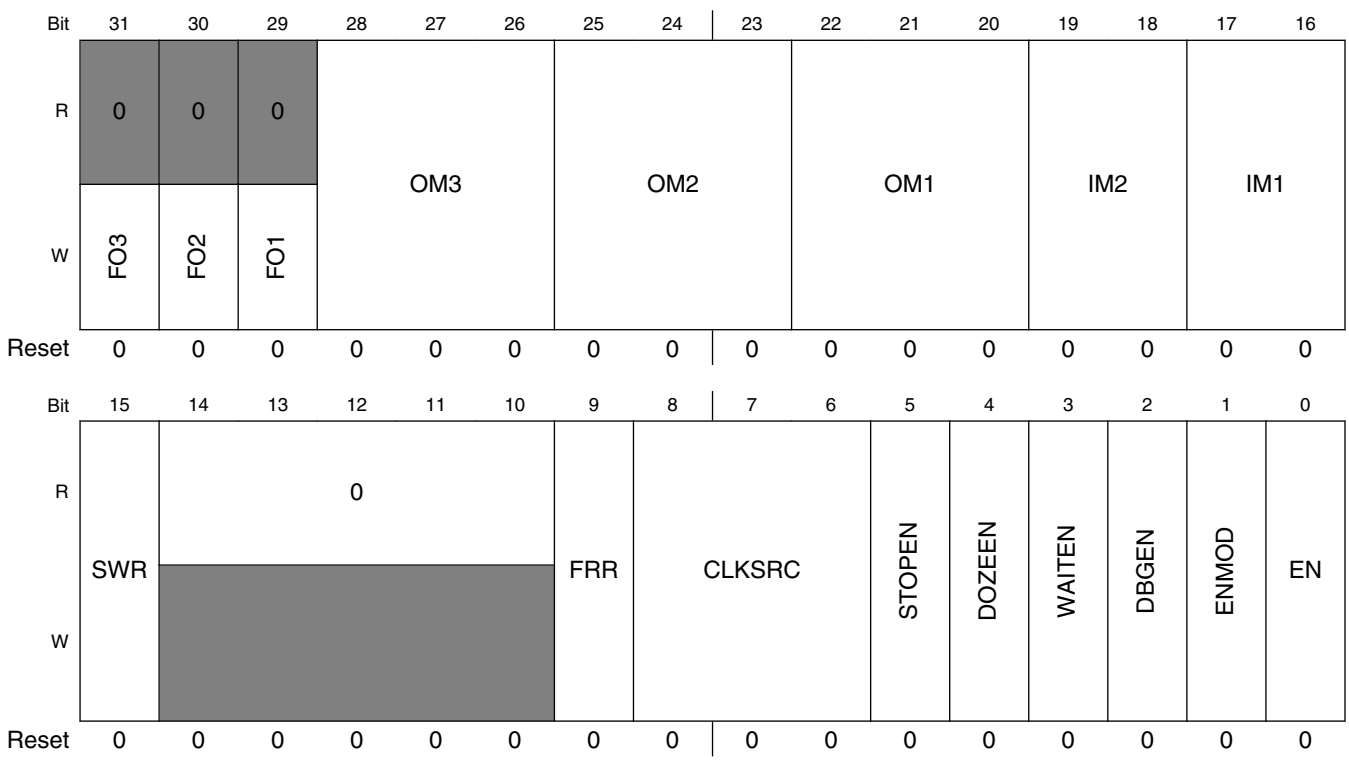
GPT memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
209_8018	GPT Output Compare Register 3 (GPT_OCR3)	32	R/W	FFFF_FFFFh	30.6.7/1507
209_801C	GPT Input Capture Register 1 (GPT_ICR1)	32	R	0000_0000h	30.6.8/1508
209_8020	GPT Input Capture Register 2 (GPT_ICR2)	32	R	0000_0000h	30.6.9/1508
209_8024	GPT Counter Register (GPT_CNT)	32	R	0000_0000h	30.6.10/ 1509

30.6.1 GPT Control Register (GPT_CR)

The GPT Control Register (GPT_CR) is used to program and configure GPT operations. An IP Bus Write to the GPT Control Register occurs after one cycle of wait state, while an IP Bus Read occurs after 0 wait states.

Address: 209_8000h base + 0h offset = 209_8000h



GPT_CR field descriptions

Field	Description
31 FO3	FO3 Force Output Compare Channel 3 FO2 Force Output Compare Channel 2

Table continues on the next page...

GPT_CR field descriptions (continued)

Field	Description
	FO1 Force Output Compare Channel 1 The FO*n* bit causes the pin action *programmed* for the timer Output Compare *n* pin (according to the OM*n* bits in this register). • The OF*n* flag (OF3, OF2, OF1) in the status register is **not affected**. • This bit is self-negating and always read as zero. 0 Writing a 0 has no effect. 1 Causes the programmed pin action on the timer Output Compare *n* pin; the OF*n* flag is not set.
30 FO2	See F03
29 FO1	See F03
28–26 OM3	OM3 (bits 28-26) controls the Output Compare Channel 3 operating mode. OM2 (bits 25-23) controls the Output Compare Channel 2 operating mode. OM1 (bits 22-20) controls the Output Compare Channel 1 operating mode. The OM*n* bits specify the response that a compare event will generate on the output pin of Output Compare Channel *n*. • The toggle, clear, and set options cause a change on the output pin *only* if a compare event occurs. • When OM*n* is programmed as 1xx (active low pulse), the output pin is set to one immediately on the next input clock; a low pulse (that is an input clock in width) occurs when there is a compare event. Note that here, "input clock" refers to the clock selected by the CLKSRC bits of the GPT Control Register. 000 Output disconnected. No response on pin. 001 Toggle output pin 010 Clear output pin 011 Set output pin 1xx Generate an active low pulse (that is one input clock wide) on the output pin.
25–23 OM2	See OM3
22–20 OM1	See OM3
19–18 IM2	IM2 (bits 19-18, Input Capture Channel 2 operating mode) IM1 (bits 17-16, Input Capture Channel 1 operating mode) The IM*n* bit field determines the transition on the input pin (for Input capture channel *n*), which will trigger a capture event. 00 capture disabled 01 capture on rising edge only 10 capture on falling edge only 11 capture on both edges
17–16 IM1	See IM2
15 SWR	Software reset. This is the software reset of the GPT module. It is a self-clearing bit. • The SWR bit is set when the module is in reset state.

Table continues on the next page...

GPT_CR field descriptions (continued)

Field	Description
	• The SWR bit is cleared when the reset procedure finishes. • Setting the SWR bit resets **all of the registers** to their default reset values, except for the CLKSRC, EN, ENMOD, STOPEN, WAITEN, and DBGEN bits in the GPT Control Register (this control register). 0 GPT is not in reset state 1 GPT is in reset state
14–10 Reserved	This read-only field is reserved and always has the value 0.
9 FRR	Free-Run or Restart mode. The FFR bit determines the behavior of the GPT when a compare event in channel 1 occurs. • In Restart mode, after a compare event, the counter resets to 0x00000000 and resumes counting (after the occurrence of a compare event). • In Free-Run mode, after a compare event, the counter continues counting until 0xFFFFFFFF and then rolls over to 0. 0 Restart mode 1 Free-Run mode
8–6 CLKSRC	Clock Source select. The CLKSRC bits select which clock will go to the prescaler (and subsequently be used to run the GPT counter). • The CLKSRC bit field value should only be changed after disabling the GPT by clearing the EN bit in this register (GPT_CR). • A software reset does not affect the CLKSRC bit. 000 No clock 001 Peripheral Clock 010 High Frequency Reference Clock 011 External Clock (CLKIN) 100 Low Frequency Reference Clock 101 Crystal oscillator divided by 8 as Reference Clock 111 Crystal oscillator as Reference Clock others Reserved
5 STOPEN	GPT Stop Mode enable. The STOPEN read/write control bit enables GPT operation *during Stop mode*. • A hardware reset resets the STOPEN bit. • A software reset *does not affect* the STOPEN bit. 0 GPT is disabled in Stop mode. 1 GPT is enabled in Stop mode.
4 DOZEEN	GPT Doze Mode Enable. • A hardware reset resets the DOZEEN bit. • A software reset *does not affect* the DOZEEN bit. 0 GPT is disabled in doze mode. 1 GPT is enabled in doze mode.
3 WAITEN	GPT Wait Mode enable. The WAITEN read/write control bit enables GPT operation *during Wait mode*.

Table continues on the next page...

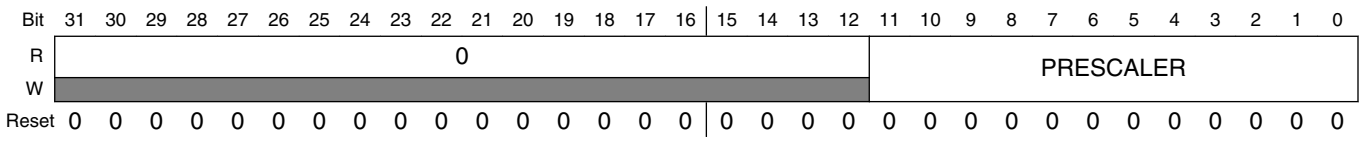
GPT_CR field descriptions (continued)

Field	Description
	• A hardware reset resets the WAITEN bit. • A software reset *does not affect* the WAITEN bit. 0 GPT is disabled in wait mode. 1 GPT is enabled in wait mode.
2 DBGEN	GPT debug mode enable. The DBGEN read/write control bit enables GPT operation *during Debug mode*. • A hardware reset resets the DBGEN bit. • A software reset *does not affect* the DBGEN bit. 0 GPT is disabled in debug mode. 1 GPT is enabled in debug mode.
1 ENMOD	GPT Enable mode. When the GPT is disabled (EN=0), then both the Main Counter and Prescaler Counter *freeze their current count values*. The ENMOD bit determines the value of the GPT counter when Counter is enabled again (if the EN bit is set). • If the ENMOD bit is 1, then the Main Counter and Prescaler Counter values are reset to 0 after GPT is enabled (EN=1). • If the ENMOD bit is 0, then the Main Counter and Prescaler Counter restart counting *from their frozen values* after GPT is enabled (EN=1). • If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter *freeze at their current count values* when the GPT enters low power mode. • When GPT exits low power mode, the Main Counter and Prescaler Counter start counting from their frozen values, regardless of the ENMOD bit value. • Setting the SWR bit will clear the Main Counter and Prescaler Counter values, regardless of the value of EN or ENMOD bits. • A hardware reset resets the ENMOD bit. • A software reset *does not affect* the ENMOD bit. 0 GPT counter will retain its value when it is disabled. 1 GPT counter value is reset to 0 when it is disabled.
0 EN	GPT Enable. The EN bit is the GPT module enable bit. **Before setting the EN bit**, we recommend that *all registers be properly programmed*. • A hardware reset resets the EN bit. • A software reset *does not affect* the EN bit. 0 GPT is disabled. 1 GPT is enabled.

30.6.2 GPT Prescaler Register (GPT_PR)

The GPT Prescaler Register (GPT_PR) contains bits that determine the *divide value* of the clock that runs the counter.

Address: 209_8000h base + 4h offset = 209_8004h



GPT_PR field descriptions

Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
PRESCALER	Prescaler bits. The clock selected by the CLKSRC field is divided by [PRESCALER + 1], and then used to run the counter. • A change in the value of the PRESCALER bits cause the Prescaler counter to reset and a new count period to start immediately. • See Figure 30-3 for the timing diagram. 0x000 Divide by 1 0x001 Divide by 2 ... ... 0xFFF Divide by 4096

30.6.3 GPT Status Register (GPT_SR)

The GPT Status Register (GPT_SR) contains bits that indicate that a counter has rolled over, and if any event has occurred on the Input Capture and Output Compare channels. The bits are cleared by writing a 1 to them.

Address: 209_8000h base + 8h offset = 209_8008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1 OF2IE	See OF3IE
0 OF1IE	See OF3IE

30.6.5 GPT Output Compare Register 1 (GPT_OCR1)

The GPT Compare Register 1 (GPT_OCR1) holds the value that determines when a compare event will be generated on Output Compare Channel 1. Any write access to the Compare register of Channel 1 while in Restart mode (FRR=0) will reset the GPT counter.

An IP Bus Write access to the GPT Output Compare Register1 (GPT_OCR1) occurs *after* one cycle of wait state; an IP Bus Read access occurs *immediately* (0 wait states).

Address: 209_8000h base + 10h offset = 209_8010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

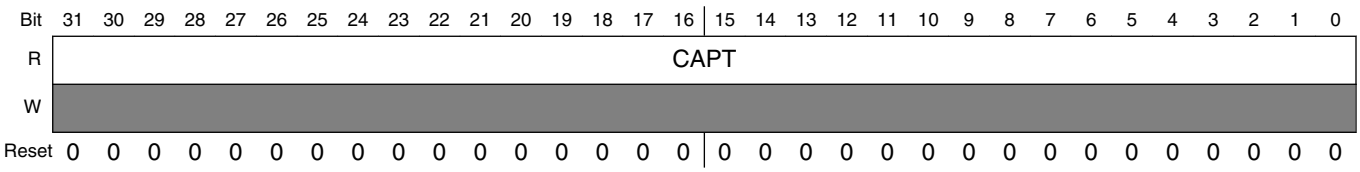
GPT_OCR3 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 3.

30.6.8 GPT Input Capture Register 1 (GPT_ICR1)

The GPT Input Capture Register 1 (GPT_ICR1) is a read-only register that holds the value *that was in the counter during the last capture event* on Input Capture Channel 1.

Address: 209_8000h base + 1Ch offset = 209_801Ch



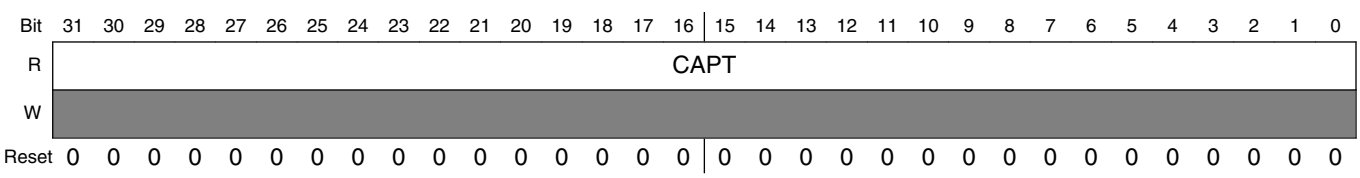
GPT_ICR1 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 1 occurs, the current value of the counter is loaded into GPT Input Capture Register 1.

30.6.9 GPT Input Capture Register 2 (GPT_ICR2)

The GPT Input capture Register 2 (GPT_ICR2) is a read-only register which holds the value that was in the counter during the last capture event on input capture channel 2.

Address: 209_8000h base + 20h offset = 209_8020h



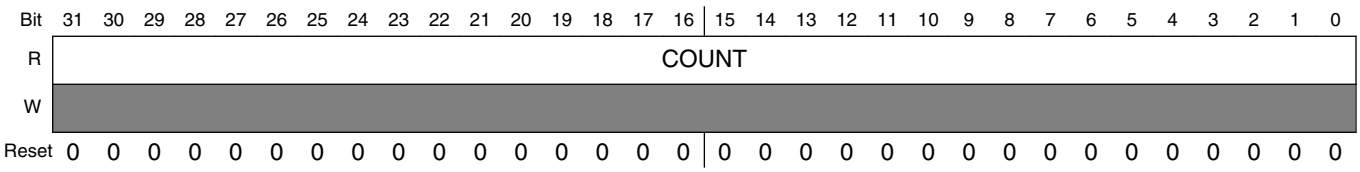
GPT_ICR2 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 2 occurs, the current value of the counter is loaded into GPT Input Capture Register 2.

30.6.10 GPT Counter Register (GPT_CNT)

The GPT Counter Register (GPT_CNT) is the main counter's register. GPT_CNT is a read-only register and can be read *without affecting the counting process* of the GPT.

Address: 209_8000h base + 24h offset = 209_8024h



GPT_CNT field descriptions

Field	Description
COUNT	Counter Value. The COUNT bits show the current count value of the GPT counter.

Chapter 31
2D Graphics Processing Unit (GPU2D)

31.1 Overview

The R2D GPU2D module is designed to display on a variety of consumer devices. Addressable screen sizes range from small displays featured on cell phones to large 1080p high definition displays.

The V2D GPU2D module is designed to display on a variety of consumer devices. Addressable screen sizes range from small displays featured on cell phones to large 1080p high definition displays.

The GPU2D cores provide powerful graphics at low power consumption, utilizing the smallest silicon footprints. Dynamic power consumption is minimized by extensive use of localized clock gating.

R2D GPU Hardware acceleration is brought to numerous 2D including graphical user interfaces (GUI), menu displays, flash animation, and gaming. The GPU R2D block diagrams is presented in the Figure 31-1.

V2D GPU Hardware acceleration is brought to numerous VG applications including graphical user interfaces (GUI), menu displays, flash animation, and gaming. The GPU V2D block diagrams is presented in the Figure 31-2.

31.2 GPU2D Block Diagram

31.2.1 R2D GPU

The R2D graphics processing unit (GPU) defines a high-performance 2D raster graphics core that accelerates the 2D graphics display.

R2D GPU supports acceleration of the following graphics APIs:

- DirectFB (on Linux)
- GDI / DirectDraw (on Windows CE)

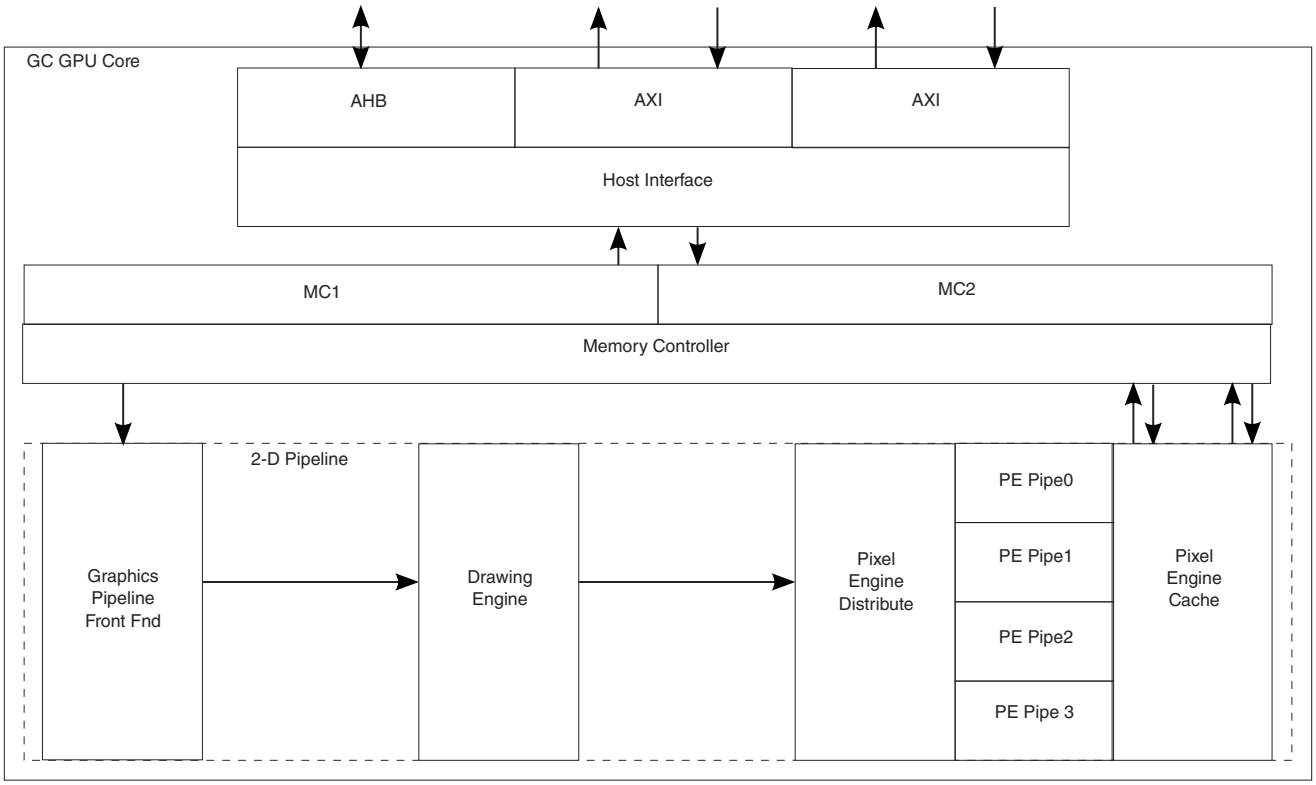


Figure 31-1. R2D GPU Block Diagram

31.2.2 V2D GPU

V2D GPU defines a high-performance graphics core designed for hardware acceleration of OpenVG vector graphics display. V2D GPU is designed for easy integration onto the SoC.

V2D GPU supports the following graphics APIs:

- OpenVG 1.1

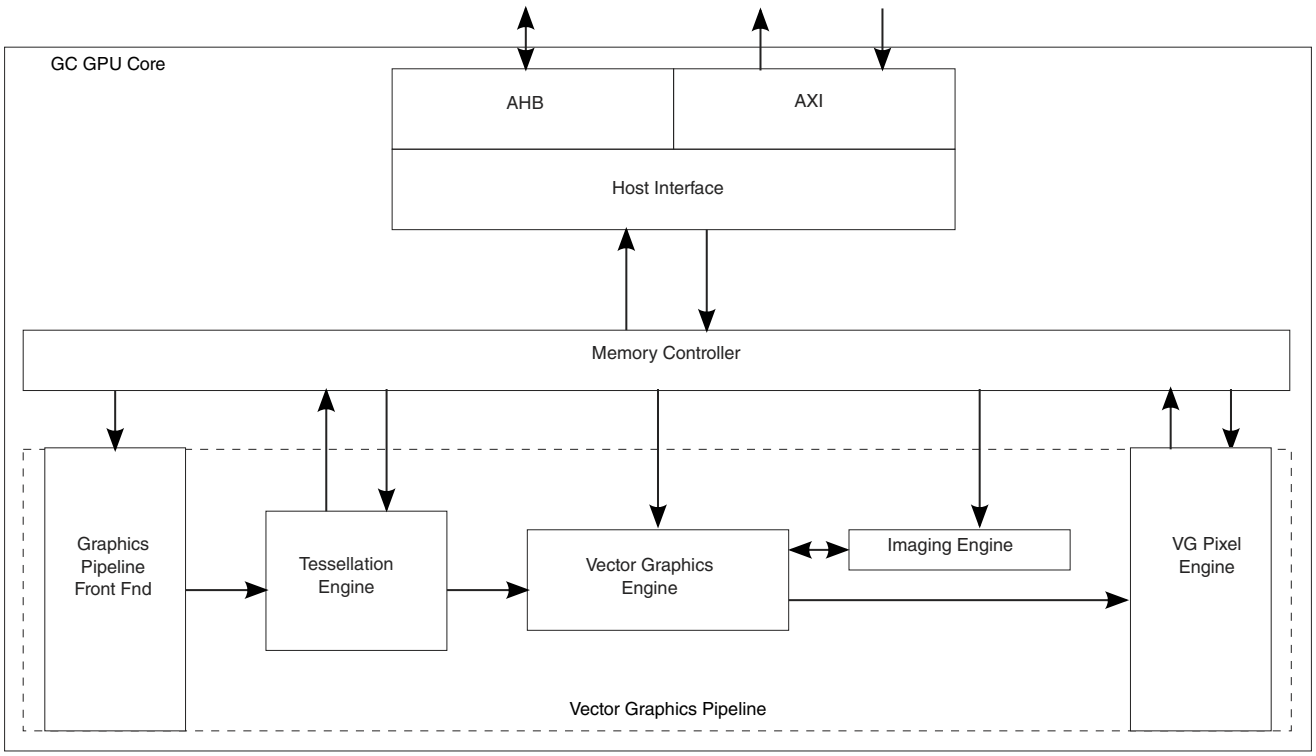

Figure 31-2. V2D GPU Block Diagram

31.3 GPU2D Features

The following sections describe the functional features of the R2D and V2D GPU.

31.3.1 Full Featured R2D GPU Pipeline

- Bit BLT
- Stretch BLT
- Rectangle fill and clear
- Line drawing
- Filter BLT
- Mono expansion for text rendering
- ROP2, ROP3, and ROP4
- Alpha blending, including Java 2 Porter-Duff compositing blending rules
- 32K x 32K coordinate system
- 90 / 180 / 270 degree rotation
- Transparency by monochrome mask, chroma key, or pattern mask

31.3.2 Full Featured V2D GPU Pipeline

- Coordinate Systems and Transformations (Image drawing uses a 3x3 perspective transformation matrix)
- Viewport Clipping, Scissoring and Alpha Masking
- Paths
- Images
- Image Filters
- Paint(gradient and pattern)
- Blending
- Higher-level Geometric Primitives
- Image Warping
- Dithering

31.4 GPU2D OPERATIONS

31.4.1 R2D GPU Operations

Information detailing the R2D GPU operations can be found in this section.

31.4.1.1 Line

Lines are rendered using the Bresenham algorithm. The Bresenham algorithm has the advantage of using integer arithmetic and has no accumulation of rounding errors.

The LINE operation draws a line. Coordinates for two points are given: start point and end point. The end point is not drawn.

In the case of line, only ROP2 and ROP4 are supported. It operates on pattern and destination. The pattern should have a transparency mask in order to use ROP4.

Clipping is supported for lines on a per pixel basis.

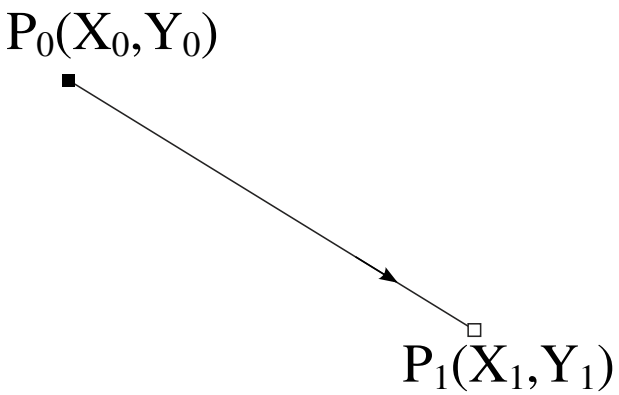

Figure 31-3. Line

31.4.1.2 Rectangle Fill and Clear

Rectangle fill creates a rectangle area with a given color or a pattern fill. Essentially rectangle fill is a pattern fill, where an 8x8 pattern is initialized with the specified color. It supports ROP2 and ROP4 with the pattern and destination as its inputs. If ROP4 is used, the pattern should have a transparency mask.

Clear is similar to rectangle fill except that it does not does not use a pattern. A 32-bit clear value with 4-bit byte mask is used to fill the entire rectangle area.

Both rectangle fill and clear support clipping, which is performed on a per primitive basis.

31.4.1.3 BitBLT

Bit blit transfers data from one area of a memory (source) to another area of the memory (destination).

The source and destination can be from the same or different memory locations. Both source and destination must be described by a rectangular area. The source and destination rectangles can be the same size (most bit blits are of this nature) or they can be different sizes, in which case the operation becomes a stretch or shrink blit.

Bit blit supports ROP2, ROP3, and ROP4 which includes source, destination and pattern, and an optional transparency color.

Clipping can be performed on a primitive basis.

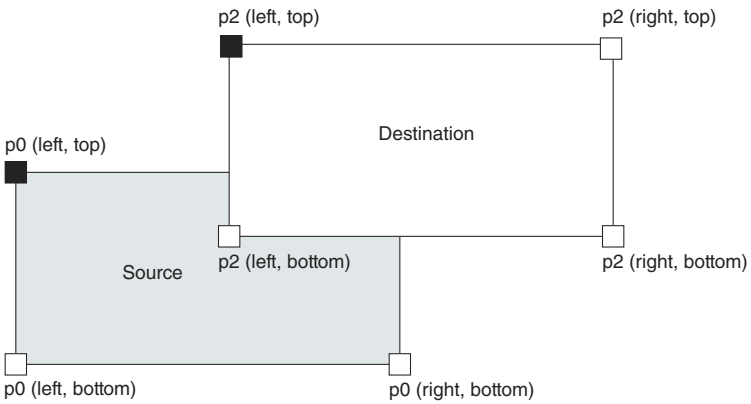

Figure 31-4. BitBLT

The BIT BLT primitive supports the following 10 source and 8 destination image formats:

Table 31-1. Bit BLT Formats

Formats	Source Image	Destination Image
A1R5G5B5	Yes	Yes
A4R4G4B4	Yes	Yes
X1R5G5B5	Yes	Yes
X4R4G4B4	Yes	Yes
R5G6B5	Yes	Yes
A8R8G8B8	Yes	Yes
X8R8G8B8	Yes	Yes
A8	Yes	Yes
1-bit monochrome	Yes	No
8-bit color index	Yes	No

NOTE

MD = Multi-Destination support

31.4.1.4 Stretch BLT

The stretch blt primitive performs a bit blt operation with stretch or shrink. The modified Bresenham algorithm is used to generate corresponding coordinates for fast stretching. The stretch factor is specified in a 15.0 fixed-point format. Stretch blit is not allowed to overlap therefore no part of source and destination can share any piece of memory. Non-stretch blits can overlap. For stretch blit, clipping is performed on a per pixel basis.

31.4.1.5 Monochrome Expansion and Mask BLT

Monochrome expansion and mask blit are different operations, although both use the bit stream from command buffer and both can be the source for ROP4 source selection. This means that each output pixel can be a combination of source, pattern, monochrome mask (for masked blits) and destination.

31.4.1.5.1 Monochrome expansion

For monochrome expansion, the bit from the stream is used to switch on/off a solid color that is defined in a register. This mechanism enables the use of just one bit per pixel to represent colors. In effect, the MONO EXPANSION primitive increases color representation from one bit per pixel to multiple bits per pixel. A typical application for mono color is font drawing.

Monochrome expansion does not support overlapping of the source and destination. It is the responsibility of the driver to make sure that the command will never be executed with overlapping source and destination.

31.4.1.5.2 Mask BLT

For Mask BLT, the bit from the stream is used to toggle on/off a color in the source frame buffer. Mask BLT takes its color source from memory and its monochrome mask from the command stream. Clipping is supported and is performed on a per pixel basis.

31.4.1.6 Filter BLT

Filter blit performs high quality scaling, up or down, using an FIR re-sampling filter with up to 9 taps. Sub-pixel coordinates (locations between the pixel grids) are generated by the drawing engine. The filter block in the drawing engine uses the sub-pixel information to select the appropriate filter kernel. R2D GPU processes 1 pixel every cycle when performing filter blit.

A stretch- or shrink-factor of 15.16 fixed-point format is supported. To generate a single destination pixel requires 9 source pixels. An image is scaled in two passes, one for X-dimension (HOR_FILTER_BLT) and the other for Y-dimension (VER_FILTER_BLT). Software sets up the filter kernel/coefficient table and the kernel size, as well as a temporary buffer for storing intermediate results. After the first pass is completed, intermediate results are sent back to memory, and then the second pass starts to scale the

first-pass image. Because of this two-step procedure, the throughput of FILTER BLT is lower than that of STRETCH BLT. Also the Filter Kernel Table may need to be reloaded, and some cycles are consumed in calculating the stepping parameters.

When the stretch or shrink factor is 1, the filterBlit works as a bitBlit copy. It can be used as format converter in that case, for instance, YUV to RGB converter. To use as a format converter, only one pass (HOR_FILTER_BLT or VER_FILTER_BLT) is needed. To optimize the memory bandwidth, when using filterBlit to do YUV to RGB filtering, the temporary target buffer format can be specified as YUY2 to process Y-dimension filtering (VER_FILTER_BLT). This is to avoid converting YUV to A8R8G8B8 in the 1st vertical pass to reduce the memory bandwidth and increase the pixel processing rate. This is the only special case that GPU may use YUY2 as target format.

The FILTER BLT primitive supports the following 13 source and 7 destination image formats:

Filter BLT Formats

Formats		Source Image	Destination Image
A1R5G5B5		Yes	Yes
A4R4G4B4		Yes	Yes
A8R8G8B8		Yes	Yes
R5G6B5		Yes	Yes
X1R5G5B5		Yes	Yes
X4R4G4B4		Yes	Yes
X8R8G8B8		Yes	Yes
YUV	NV12 (4:2:0, 2 planes)	Yes	No
	NV16 (4:2:2, 2 planes)	Yes	No
	UYVY (4:2:2, interleave)	Yes	No
	YUY2 (4:2:2, interleave)	Yes	No
	YV12 (4:2:0, 3 planes)	Yes	No
	8-bit color index	Yes	No

31.4.1.7 R2D Performance of different operations

Table 31-2. Performance of different operations without rotation

Primitive	Peak Performance	Source/destination overlap	Clipping
Line	1 pixel / cycle	N/A	Done on pixel basis
Rectangle	2.4 pixel / cycle	N/A	Done on primitive basis
Clear	2.4 pixel / cycle	N/A	Done on primitive basis

Table continues on the next page...

Table 31-2. Performance of different operations without rotation (continued)

Primitive	Peak Performance	Source/destination overlap	Clipping
Blit	2.4 pixel / cycle	Overlap is allowed	Done on primitive basis
Stretch blit	1 pixel / cycle	No overlap allowed	Done on pixel basis
Monochrome expansion	1.6 pixel / cycle	No overlap allowed	Done on pixel basis
Filter blit	1 pixel / cycle	N/A	N/A

Table 31-3. Performance of different operations with rotation

Primitive	Performance	Source/destination overlap	Clipping
Line	1 pixel / cycle	N/A	Done on pixel basis
Rectangle	2 pixel / cycle	N/A	Done on primitive basis
Clear	2 pixel / cycle	N/A	Done on primitive basis
Blit	2 pixel / cycle	Overlap is allowed	Done on primitive basis
Stretch blit	1 pixel / cycle	No overlap allowed	Done on pixel basis
Monochrome expansion	1 pixel / cycle	No overlap allowed	Done on pixel basis
Filter blit	1 pixel / cycle	N/A	N/A

31.4.1.8 Rotation

- 90° / 180° / 270° / X-Flip / Y-Flip / Mirror rotation is supported for all primitives.

31.4.1.9 Transparency Mode

For monochrome expansion:

- Opaque
- Conditional transparency. Transparent if the current pixel matches the specified value.

For blits:

- Opaque
- Masked transparency. Transparent if the mask for the current pixel or pattern is zero.
- Source Conditional transparency. Transparent if the source pixel is within the specified value range.
- Destination Conditional transparency. Transparent if the destination pixel is not within the specified value range.

31.4.1.10 Clipping

One clipping rectangle is supported for all bitBlit primitives.

31.4.1.11 R2D GPU Data Formats

The graphics engine supports 14 source data formats. In addition to these 14 source formats, for RGB source formats, GPU also supports their swizzle formats (ARGB, RGBA, ABGR, BGRA) for RGB formats. For YUV formats, GPU supports their U/V swap formats.

- A1R5G5B5
- A4R4G4B4
- A8R8G8B8
- R5G6B5
- X1R5G5B5
- X4R4G4B4
- X8R8G8B8
- A8
- NV12
- NV16
- UYVY (4:2:2)
- YUY2 (4:2:2)
- YV12 (4:2:0)
- 8-bit color index

There are 8 destination data formats supported by the graphics engine. In addition to these destination RGB formats, their swizzle formats (ARGB, RGBA, ABGR, BGRA) are also supported.

- A1R5G5B5
- A4R4G4B4
- A8R8G8B8
- R5G6B5
- X1R5G5B5
- X4R4G4B4
- X8R8G8B8
- A8

31.4.1.12 ARGB Data Conversion of R2D GPU

The pixels read from source or destination will be expanded into A8R8G8B8 format to maintain lossless pixel operations. The resulting pixels will be converted into the destination format.

31.4.1.13 YUV to RGB Conversion of R2D GPU

YUV data can be converted into 8-bit per component RGB format at the output of the cache only. Once converted, there is no way back to YUV format. GPU supports BT.601 and BT.709 YUV to RGB color conversion standards.

In BT.601, the YUV to RGB conversion is done using the following approximation:

16 <= Y <= 235

16 <= U <= 240

16 <= V <= 240

A = Y - 16

B = U - 128

C = V - 128

R = clip((298*A + 410*C + 128) >> 8)

G = clip((298*A - 101*B - 209*C + 128) >> 8)

B = clip((298*A + 519*B + 128) >> 8)

The Y, U and V components are clamped prior to the conversion.

Y is clamped between 16 and 235, inclusively.

U and V are clamped between 16 and 240, inclusively.

In BT.709, the R, G, B equations are slightly changed to

R = clip((298*A + 461*C + 128) >> 8)

G = clip((298*A - 55*B - 137*C + 128) >> 8)

B = clip((298*A + 543*B + 128) >> 8)

31.4.1.14 Color Index Input Conversion Support of R2D GPU

Color index is supported for source data only. A look-up table with 256 entries is provided for indexing the data. The table is fully programmable. The conversion is done when pixels are read out of the cache.

31.4.1.15 Source/Destination Pre-multiply and De-Multiply Support

GPU supports source pre-multiply source alpha or global alpha, or source global color for global colorizing. On destination, the GPU supports destination pre-multiply destination alpha, destination de-multiply alpha.

31.4.1.16 Alpha Blending

The GPU supports alpha blending together with ROP. The alpha blending function is performed on ROP function result source.

The general alpha blending equations are:

Cd = Fs * Cs' + Fd * Cd'

Ad = Fs * As'' + Fd * Ad''

Where

- Cs' is the source color component (adjusted for NPM if necessary)
- Cd' is the destination color component (adjusted for NPM if necessary)
- As'' is the modified source alpha component
- Ad'' is the modified destination alpha component
- Fs is fraction of the source that contributes to the final value
- Fd is fraction of the destination that contributes to the final value

The blending is done in 5 logical stages (not real implementation stages):

1. Transparent/opaque conversion
   - In this stage, the incoming alpha (source or destination independently) can be inverted if needed to match the internal alpha rule. Internally, an alpha of 0 means transparent, while an alpha of "0xFF" means opaque. External content might follow the opposite rule. The output of the block is either As (Ad for destination) or 1-As (1-Ad for destination).
2. Global value substitution
   - A global alpha value from a register can be used to substitute or scale the incoming alpha. An incoming alpha As can pass-through, be directly substituted

by Ags (global alpha) or scaled by the global alpha value (As * Ags). The source and destination have distinct global alpha values.

3. Blending factor generation
   - At this stages, the blending factors are generated (refer to table below). Each alpha can take the values 0, 1, A or 1-A depending on the blending mode.
4. Final blending
   - This is the final stage which implements blending equations.

The fractions take the values described in the following table, depending on the blending mode.

Table 31-4. Blending Modes Fractions Description

Blending Mode	Fs	Fd
Clear	0	0
SRC	1	0
DST	0	1
SRC_OVER	1	1 - As"
DST_OVER	1 - Ad"	1
SRC_IN	Ad"	0
DST_IN	0	As"
SRC_OUT	1 - Ad"	0
DST_OUT	0	1 - As"
SRC_ATOP	Ad"	1 - As"
DST_ATOP	1 - Ad"	As"
XOR	1 - Ad"	1 - As"

To control the blending modes, the following register fields are used:

- 1 bit for transparent/opaque conversion for source alpha
- 1 bit for transparent/opaque conversion for destination alpha
- 2 bits for source alpha modifications, to specify the 3 cases (As, Ags, As*Ags)
- 2 bits for destination alpha modifications, to specify the 3 cases (Ad, Agd, Ad*Agd)
- 4 bits to select between the 12 blending modes
- 8-bits for global source alpha
- 8-bits for global destination alpha

Alpha blending is supported on bit blit and filter blit primitives.

31.4.1.17 GPU Cache Management

SW cache flush is supported to flush the GPU cache to memory. Auto-flush of GPU cache is also supported. SW sets up the auto-flush interval, and HW will do the cache flush automatically at programmable intervals.

31.4.2 V2D GPU Operations

Information detailing the V2D GPU operations can be found here.

31.4.2.1 OPENVG 1.1-API STANDARD for VECTOR GRAPHICS ACCELERATION

OpenVG is a royalty-free, cross-platform API managed by the member-funded consortium known as Khronos Group. It provides a low-level hardware acceleration interface for vector graphics libraries such as Flash and SVG. OpenVG is used for acceleration of high-quality vector graphics for user interfaces and text on small screen devices.

31.4.2.2 Advantages of Using OpenVG

- Hardware accelerators can reduce power consumption by up to 90% compared to a software engine.
- Scalability with high-quality rendering, including anti-aliasing, to different screen sizes without multiple bitmaps.

31.4.2.3 OpenVG Target Applications

- SVG Viewers
- Portable Mapping Applications
- E-book Readers
- Games
- Scalable User Interface

31.4.2.4 OpenVG Features

31.4.2.4.1 Core API

- Coordinate Systems and Transformations (Image drawing uses a 3x3 perspective transformation matrix)
- Viewport Clipping, Scissoring and Alpha Masking
- Paths
- Images
- Image Filters
- Paint (gradient and pattern)
- Blending
- Dithering

31.4.2.4.2 The VGU Utility Library

- Higher-level Geometric Primitives
- Image Warping

31.4.2.4.3 OpenVG Rendering Pipeline

- Stage 1: Path, Transformation, Stroke, and Paint
- Stage 2: Stroked Path Generation
- Stage 3: Transformation
- Stage 4: Rasterization
- Stage 5: Clipping and Masking
- Stage 6: Paint Generation
- Stage 7: Image Interpolation
- Stage 8: Blending and Anti-aliasing

Chapter 32
3D Graphics Processing Unit (GPU3D)

32.1 Overview

The GPU3D is a high-performance core that delivers hardware acceleration for 3D graphics display.

Addressable screen sizes range from the smallest cell phones to HD 1080p displays. It provides high performance, high quality graphics, low power consumption, and the smallest silicon footprint.

GPU3D accelerates numerous 3D graphics applications, including graphical user interfaces (GUI), menu displays, flash animation, and gaming. This module supports the following graphics APIs:

- OpenGL ES 2.0
- OpenGL ES 1.1
- OpenVG 1.1
- DirectX 11 (9_3)
- OpenGL 2.1 and 3.0
- OpenCL 1.1 E
- EGL 1.4

32.2 GPU3D Block Diagram

The main functional units of the GPU3D are shown in the figure below and their description is as follows:

- Host Interface: Allows GPU3D to communicate with external memory and the CPU through AXI or AHB bus. In this block data crosses clock domain boundaries.
- Memory Controller: Internal memory management unit that controls the block-to-host memory request interface.

- Graphic Pipeline Front End: Inserts high level primitives and commands into the graphics pipeline.
- Ultra-threaded Unified Shader: SIMD processor that performs as both vertex shader and fragment shader. When used as a vertex shader it performs geometry transformations and lighting computations. When used as a fragment shader it applies texture data and computes color values for each pixel. GPU3D has four (4) such shaders.
- 3D Rendering Engine: Converts triangles and lines into pixels. Computes slopes of color attributes and texture coordinates. Performs clipping.
- Texture Engine: Retrieves texture information from memory upon request by the fragment shader. Performs interpolation and filtering, and transfers the computed value to the fragment shader or the vertex shader. The texture unit can process two pixels or two vertices/cycle.
- Pixel Engine/Resolve: Pixel engine does alpha blending and visible surface determination. Resolve does tiling and de-tiling as well as FSAA filtering. The pixel engine can process two pixels/cycle.

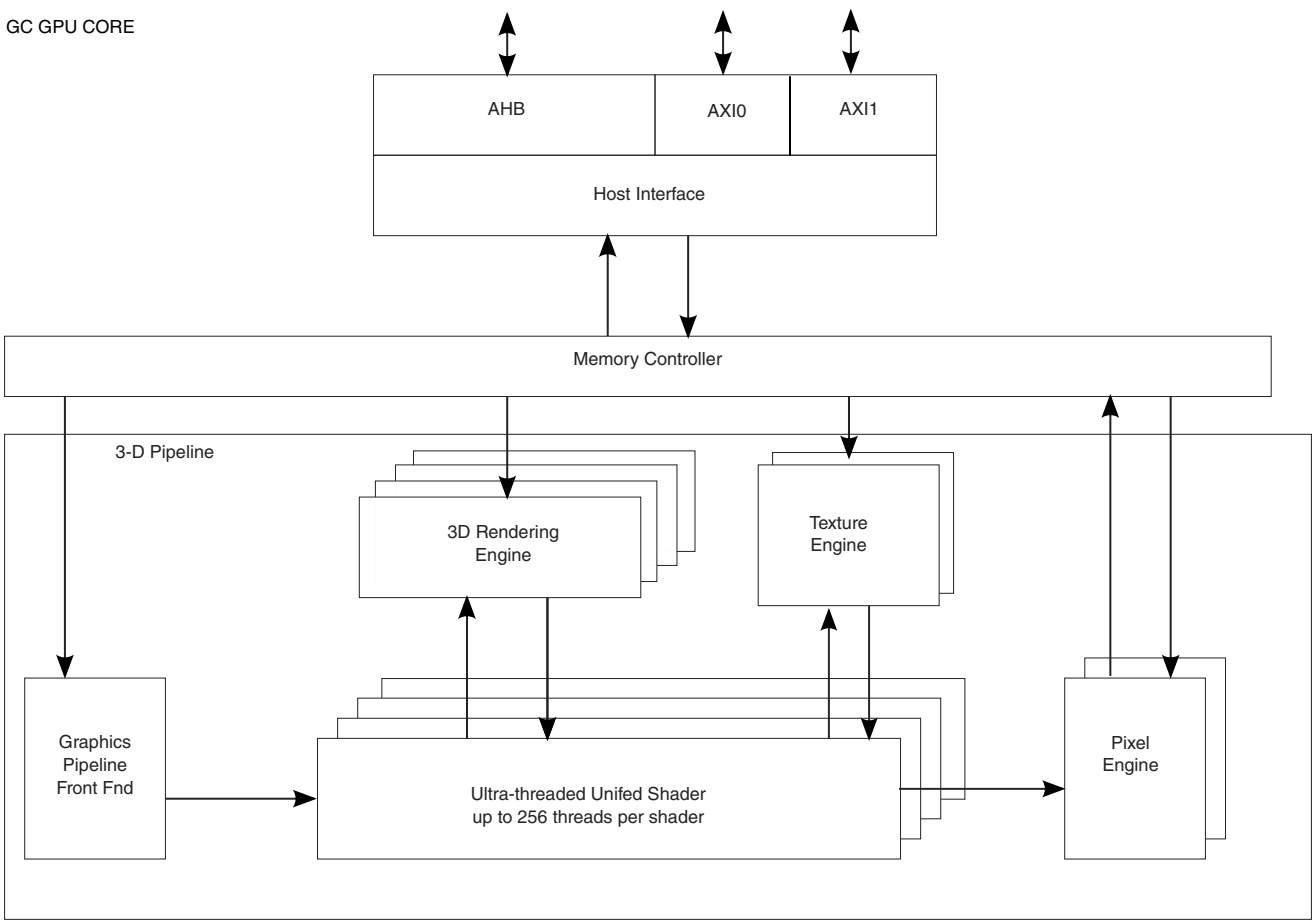

Figure 32-1. GPU3D Top Level Block Diagram

There are two main clocks for the processing control: shader clk for the shader part, and core clk for the remaining part. The core clk and shader clk frequency are programmable in CCM (as the clk frequency for GPU3D_CORE_CLK_ROOT, GPU3D_SHADER_CLK_ROOT).

The GPU3D provides architectural support for the following features:

Table 32-1. GPU3D Architectural Support

Feature	GPU Support
Primary API	OpenGL ES1.1, 2.0, and 3.0 OpenCL1.1
Additional API's	OpenVG1.1
	OpenGL
	OpenCL
Other Graphics Support	EGL1.4
Drivers	OpenGLES1.1 and Halti
	OpenVG1.1
	EGL1.4
	OpenGL2.1 and 3.0
	OpenCL1.1 EP
Operating Systems	Windows CE
	Linux Embedded
Z (depth)	Early Z support included
Stencil	Early stensil support included
Shader Languages	GLSL ES 1.0
Shader model compatability	Shader model 3.0
Shader types and execution units	Four programmable Scalable Ultra-threaded Unified Shaders (SIMD4:transcendental,ctl-flow,tx-load) one instruction issue per shader per clock; IEEE 32-bit floating-point pipeline supports long shader instructions
FSAA anti-aliasing mechanisms	High quality MSAA 4x MSAA 16x for OpenVG
Code and data memory location restrictions	Unrestricted; arbitrary memory reads and writes
Physical address	32 bits
MMU description	32-bit virtual address, 4 kB pages, error reporting outside of address space
TLB	4 cache lines per requestor
Resource locks with CPU	Semaphore lock
Max memory latency without a performance hit	256 GPU cycles

32.3 GPU3D Hardware Features

The GPU3D block has the following hardware features:

- OpenGL ES 2.0 compliance, including extensions; OpenGL ES 1.1; OpenVG 1.1
- IEEE 32-bit floating-point pipeline
- Ultra-threaded, unified vertex and fragment shaders
- Low bandwidth at both high and low data rates
- Low CPU loading
- Up to 16 programmable elements per vertex
- Dependent texture operation with high-performance
- Alpha blending
- Depth and stencil compare
- Support for 16 fragment shader simultaneous textures
- Support for 16 vertex shader simultaneous textures
- Point sampling, bi-linear sampling, tri-linear filtering, and cubic textures
- Resolve and fast clear
- 8k x 8k texture size and 8k x 8k rendering target
- 8 Vertex DMA streams
- 2 texture units and 2 pixel units for higher pixel processing rate

Table 32-2. Unified vertex-fragment shader features

Feature	GPU Support
Shader type and execution units	Four (4) unified shaders, SIMD4, SFP32 Trans
Swizzle capabilities	Full 32-bit word level swizzle in a 128-bit vector
GPR's per shader	Up to 512 general purpose registers, 128 bits each
Uniform registers	Vertex Shader: 168 registers, 128 bits each Fragment Shader: 64 registers, 128 bits each
FP denorm and rounding options	Denorms are set to zero. Supports rounding to zero.
Maximum number of data input attributes	Maximum of 16 vertex shader input elements; Maximum of 12 fragment shader input elements;
Maximum number of instructions	512 unified for both vertex and fragment shaders
Maximum number of vertex streams	8
Maximum number of threads in flight per shader core	256
Subroutines	4 levels
Conditional branch support	GT, LT, EQ, GE, LE, NE, ISNAN, ISFINITY, ISINFINITY, ISNORMAL, AND, OR, XOR, NOT, ANYMSB, ALLMSB, SELMSB
Shader instruction rate	1-cycle throughput for all shader instructions
Floating-point instruction precision	Transcendental: 22 bits SIMD4 (vector): 23.5 bits
Fragment shader video	Supports video texture

Table continues on the next page...

Table 32-2. Unified vertex-fragment shader features (continued)

Feature	GPU Support
Control flow instructions	Yes
Standard derivatives	Yes
Integer pipeline	Support 8, 16, 32-bit integer operations
Local shared memory	1 kB
L1 Cache	4 kB

Table 32-3. Vertex Processing Features

Feature	GPU Support
Vx D3D, OGL ES formats supported	BYTE, UBYTE, SHORT, USHORT, INT, UINT, DEC, UDEC, FLOAT, FLOAT16, D3DCOLOR, FIXED16DOT16,R10B10G10A02
Vertex data size limits	256 bytes
Pre shader cache	2 kB
Post shader cache	8/16 vertices

Table 32-4. Primitive Processing Features

Feature	GPU Support
Primitives supported	triangle strip, fan, and list; line strip line loop and list; point list
Vertex/primitive geometry input index sizes	8-bit ,16-bit and 32-bit indices
Setup parameters available to fragment shader	12 vec4 parameters; all available to fragment shader
Primitive restart	Yes
AA line support	Yes

Table 32-5. Texture Processing Features

32.3.4 Z/Stencil Buffer

Table 32-9. Z/Stencil Buffer Features

Feature	GPU Support
Z/stencil formats	16-bit Z; 24-bit Z plus 8-bit stencil, with lossless compression support
Z/stencil buffer	32 cache lines; 64 bytes per line;
Z compression	Yes, 30% - 70%
Stencil compression	Yes
Fast clear and initialization options	Yes

32.3.5 Render Target

Feature	GPU Support
Formats	16-bit and 32-bit, with lossless compression support
RT buffer cache	32 cache lines; 64 bytes per line; RT caches are fully set associative.
Compressed formats	Yes, 30% - 70%
Fast clear and initialization options	Yes
Multi-Render Target support	4 Targets

32.4 Usage Mode

The GPU3D should be programmed through the Freescale provided driver. Freescale does not provide support for software that directly programs the GPU3D registers. APIs for programming the GPU3D through the software driver are described in separate driver documentation.

Chapter 33
HDMI Transmitter (HDMI)

33.1 Overview

33.1.1 HDMI Operational Model Overview

The High Definition Multimedia Interface (HDMI) is a wired digital interconnect that replaces the analog TV out or VGA out.

HDMI is capable of transferring uncompressed video, audio, and data using a single cable. The video pixel rates are typically from 25 MHz up to 266 MHz (and 3D video modes), but HDMI can support higher rates up to 266 MHz. It can support S/PDIF (IEC60958 L-PCM and IEC61937 compressed non-linear PCM: AC-3, MPEG-1/-2 Audio, DTS®, MPEG-2/-4 AAC, ATRAC, WMA, MAT) and Parallel HBR (high bit rate) audio interface, enabling the support of Dolby® True-HD and DTS-HD Master Audio. HDMI has the capability of automatically setting the display format configuration (intelligent link).

HDMI include a content protection system called HDCP (High-bandwidth Data Content Protection). The HDMI connections can be used to connect DVD recorders, set-top boxes, and game consoles to flat panel televisions and an AV amplifier that can act as repeater/router.

HDMI system architecture consists of sources (transmitter) and sinks (receiver). As shown in the figure below, the HDMI cable and connectors carry four differential pairs that make up the TMDS data and clock channels. These channels are used to carry video, audio, and auxiliary data. In addition, HDMI carries a VESA Data Display Channel (DDC). The DDC is used for configuration and status exchange between a single source and a single sink. The optional CEC protocol provides high-level control functions between all of the various audiovisual products in a user's environment.

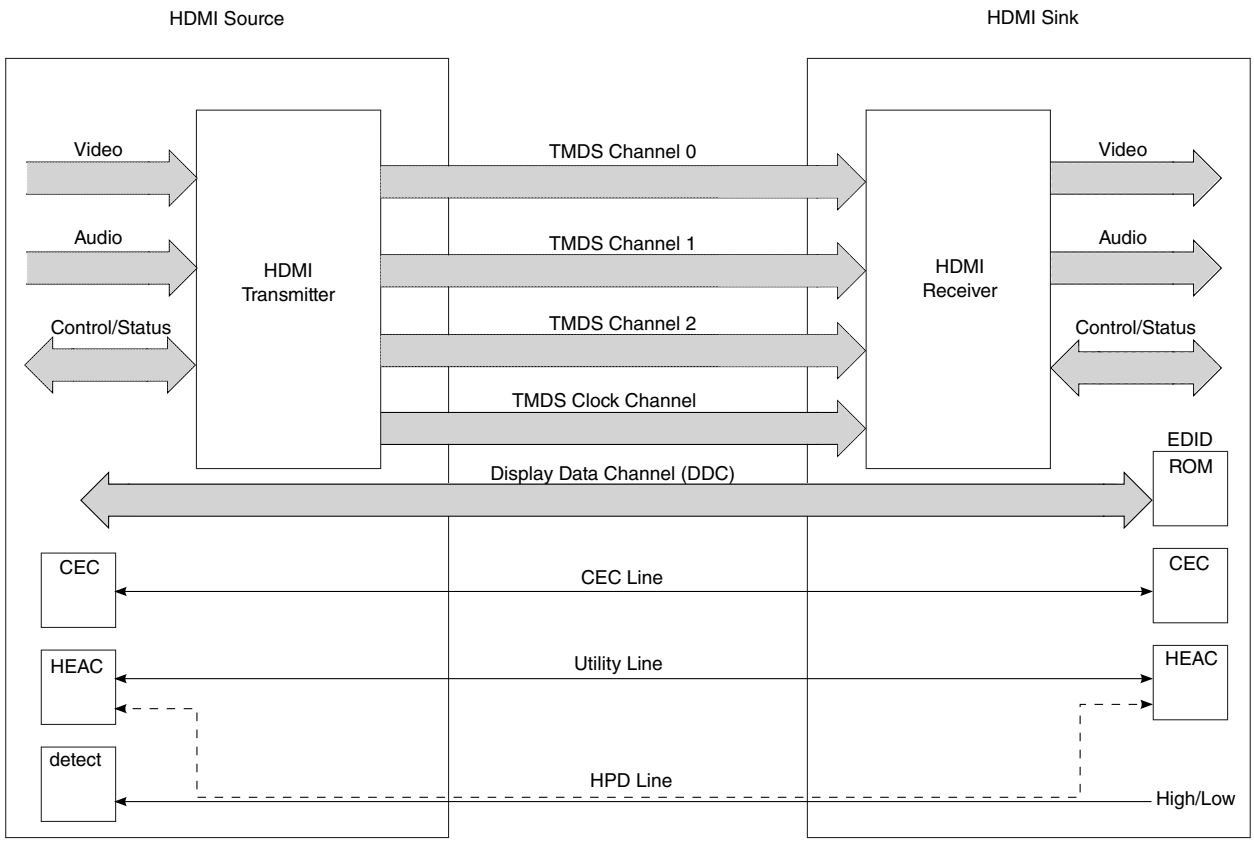

Figure 33-1. HDMI Block Diagram

Audio, video, and auxiliary data is transmitted across the three TMDS data channels. A TMDS clock running at 1x (24-bit true color mode), the video pixel rate is transmitted on the TMDS clock channel and used by the receiver as a frequency reference for data recovery on the three TMDS data channels. Video data can have a pixel size of 24bits . Video at the default 24-bit color depth is carried at a TMDS clock rate equal to the pixel clock rate. Higher color depths are carried using a correspondingly higher TMDS clock rate. Video formats with TMDS rates below 25MHz (such as, 13.5MHz for 480i/NTSC) can be transmitted using a pixel-repetition scheme. The video pixels can be encoded in either RGB, YCBCR 4:4:4, or YCBCR 4:2:2 formats.

HDMI uses a packet structure to transmit audio and auxiliary data across the TMDS channels. To attain the highest reliability required of audio and control data, this data is protected with a BCH error correction code and is encoded using a special error reduction code to produce the transmitted 10-bit word.

Basic audio functionality consists of a single IEC 60958 L-PCM audio stream (two audio channels) at sample rates of 32 KHz, 44.1 KHz, or 48 KHz, which can accommodate any normal stereo stream. Optionally, HDMI can carry audio at sample rates up to 192KHz

and with three to eight audio channels. HDMI can also carry an IEC 61937 compressed (such as, surround sound) audio stream at bit rates up to 24.576 Mbps. For bit rates above 6.144 Mbps, compressed audio streams conforming to IEC 61937 are carried using HBR Audio Stream Packets. Each packet carries four IEC 60958 frames, which corresponds to (4x2x16 =) 128 contiguous bits of an IEC 61937 stream.

The source uses the DDC to read the sink's Enhanced Extended Display Identification Data (E-EDID) to obtain the sink's configuration and/or capabilities.

The HDMI TX Controller schedules the three periods: Video Data Period, Data Island period, and Control period. During the Video Data Period, the active pixels of an active video line are transmitted. During the Data Island period, audio and auxiliary data are transmitted using a series of packets. The Control period is used when no video, audio, or auxiliary data needs to be transmitted. A Control Period is required between any two periods that are not Control Periods.

An example of each period placement is shown in the figure below.

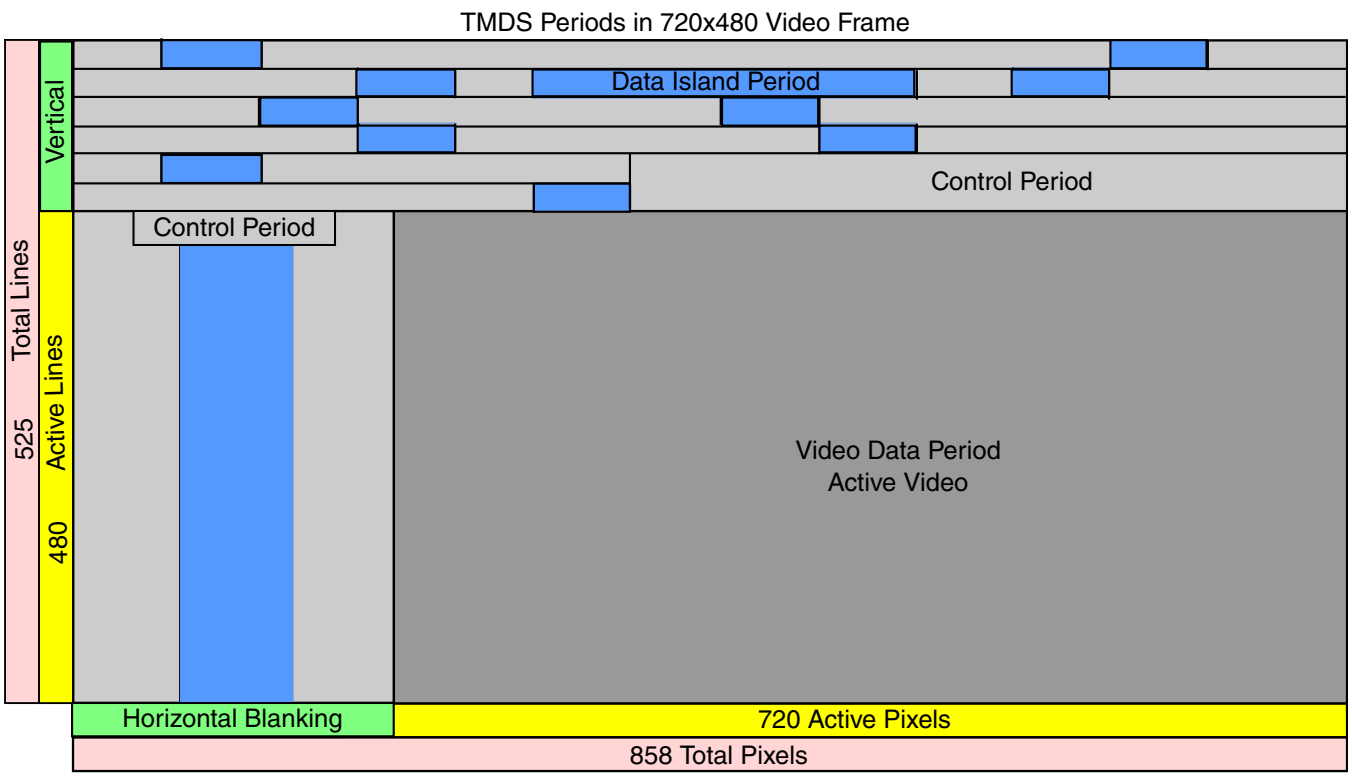

Figure 33-2. TMDS Periods in 720x480p Video Frame

33.1.1.1 Interfaces

HDMI TX has the following interfaces:

- HDCP interface
- External ROM interface for key storage
- External RAM interface for revocation
- Random number generator interface
- Video input interface
- RGB 4:4:4
- YCbCr4:2:2
- YCbCr4:4:4
- Digital audio input interface
- AHB audio DMA
- System interface
- AMBA AHB
- Scan test interface
- HDMI TX PHY interface
- CEC interface

33.1.1.2 Features

HDMI TX includes the following features:

- Supported video formats:
- All CEA-861-E video formats up to 1080p at 60Hz and 720p/1080i at 120Hz
- Supported colorimetry:
- 24bit RGB 4:4:4
- 24bit YCbCr 4:4:4
- 16bit YCbCr 4:2:2
- xvYCC601
- xvYCC709
- Integrated color space converter:
- RGB(4:4:4) to/from YCbCr(4:4:4 or 4:2:2)
- Optional HDMI 1.4a supported video formats:
- HDMI 1.4a 3D video modes with up to 266MHz (TMDS clock)
- Optional HDMI 1.4a supported colorimetry:
- sYCC601
- Adobe RGB
- Adobe YCC601
- Optional HDMI 1.4a supported Infoframes:
- Audio InfoFrame packet extension to support LFE playback level information
- AVI infoFrame packet extension to support YCC Quantization range (Limited Range, Full
- Range)

- AVI infoFrame packet extension to support Content type (Graphics, Photo, Cinema, Game)
- Supported Audio formats:
- Up to four I^2S interface for eight-channel Linear-PCM audio
- S/PDIF interface for linear and non-linear PCM formats:
  - AC-3
  - MPEG-1/-2 Audio
  - DTS
  - MPEG- 2/-4 AAC
  - ATRAC
  - WMA
  - MAT
- Parallel audio interface for High-Bit Rate (HBR) Audio:
  - Dolby® True-HD
  - DTS®-HD Master Audio
  - Generic Parallel Audio interface
- AHB DMA Audio interface
- Up to 192 KHz IEC60958 audio sampling rate
- Pixel clock from 13.5MHz up to 266 MHz
- Option to remove pixel repetition clock (prepclk) from HDMI TX interface for an easy integration with third-party HDMI TX PHYs
- Flexible synchronous enable per clock domain to set functional power down modes
- Register access:
- AMBA AHB
- I^2C DDC, EDID block read mode
- Advanced PHY testability
- Integrated CEC hardware engine

33.2 External Signals

See HDMI PHY for external signal information.

33.3 Clocks

The table found here describes the clock sources for HDMI.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 33-1. HDMI Clocks

Clock name	Clock Root	Description
iahbclk	ahb_clk_root	Bus clock
icecclk	ckil_sync_clk_root	CEC low-frequency clock (32kHZ)
ihclk	ahb_clk_root	Module clock
isfrclk	video_27m_clk_root	Internal SFR clock (video clock 27MHz)

33.4 Functional Description

This section describes the functional architecture of the HDMI TX controller.

33.4.1 HDMI TX Functional Overview

The HDMI TX provides a variety of standard audio, video, and system interfaces.

It includes an high-bandwidth data content protection (HDCP) encryption engine for HDMI receiver authentication, revocation, and data encryption.

Figure below illustrates the top level diagram of the HDMI TX solution.

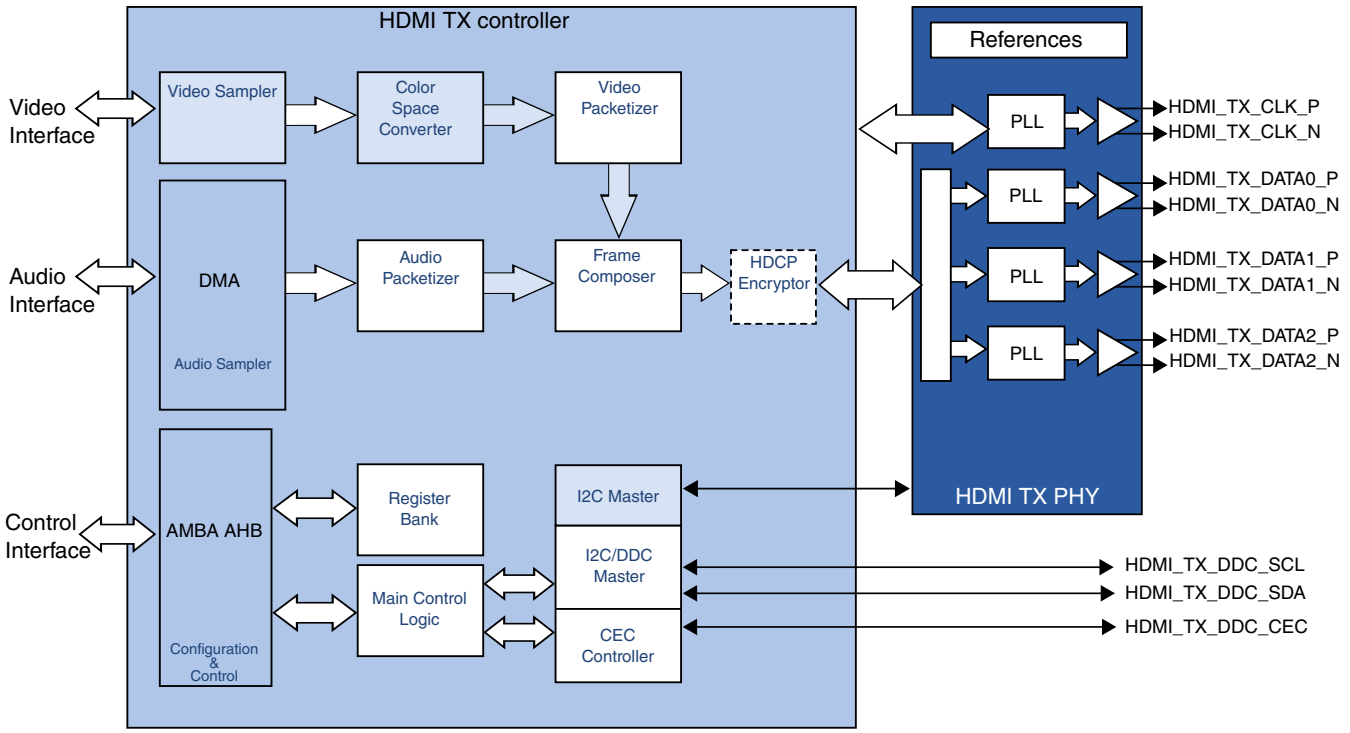

Figure 33-3. HDMI TX Top Level Block Diagram

The HDCP encryption engine is responsible for HDMI receiver authentication, revocation, and data encryption.

The input video stream can be either RGB 4:4:4, YcbCr 4:2:2, or YcbCr 4:44 in single data rate (SDR) bus formats as described in Table 33-2. The video mode's timing format must follow the CEA-861-E specification. An embedded color space conversion allows the pixel color format to be converted on the HDMI source side to match the best with the HDMI sink capabilities. 24

The input audio stream can be provided through audio AHB DMA interface;

Finally, HDMI_TX can output video in full HD with up to 48-bit color mode and inserts high fidelity audio up to eight-channels over low resolution video formats by performing automatic pixel repetition over the input video stream.

33.4.2 Video Pixel Sampler

The Video pixel sampler block is responsible for the video data synchronization, according to the video data input mapping defined by the Color Depth (Deep Color) and format configuration.

Optionally, for YCbCr 4:2:2 format, data mapping can be performed to conform to ITU. 601 and ITU.656 standards but without the support of embedded synchronizers.

The video pixel sampler registers base address is 0x0200.

33.4.2.1 HDMI Transmitter Controller Databook Functional Description

Table 33-2. Input Data Mapping

Video Input Format		ivdata[47:0] mapping																							
Color Space	Color Depth	47-46	45-44	43-42	41-40	39-38	37-35	35-34	33-32	31-30	29-28	27-26	25-24	23-22	21-20	19-18	17-16	15-14	13-12	11-10	9-8	7-6	5-4	3-2	1-0
RGB 4:4:4	8-bit	R[7:0]								G[7:0]								B[7:0]							
YCbCr 4:4:4	8-bit	Cb[7:0]								Y[7:0]								Cr[7:0]							
YCbCr 4:2:2	8-bit	Cb[7:0]								Y[7:0]															
		Cr[7:0]								Y[7:0]															

For each video timing format, there is a specific timing parameters defined in the CEA-861-E specification.

The following timing diagram is an example for the video mode format 1 (640x480p @ 59.94/60 Hz): Data Enable = idataen, HSYNC = ihsync, VSYNC = ivsync.

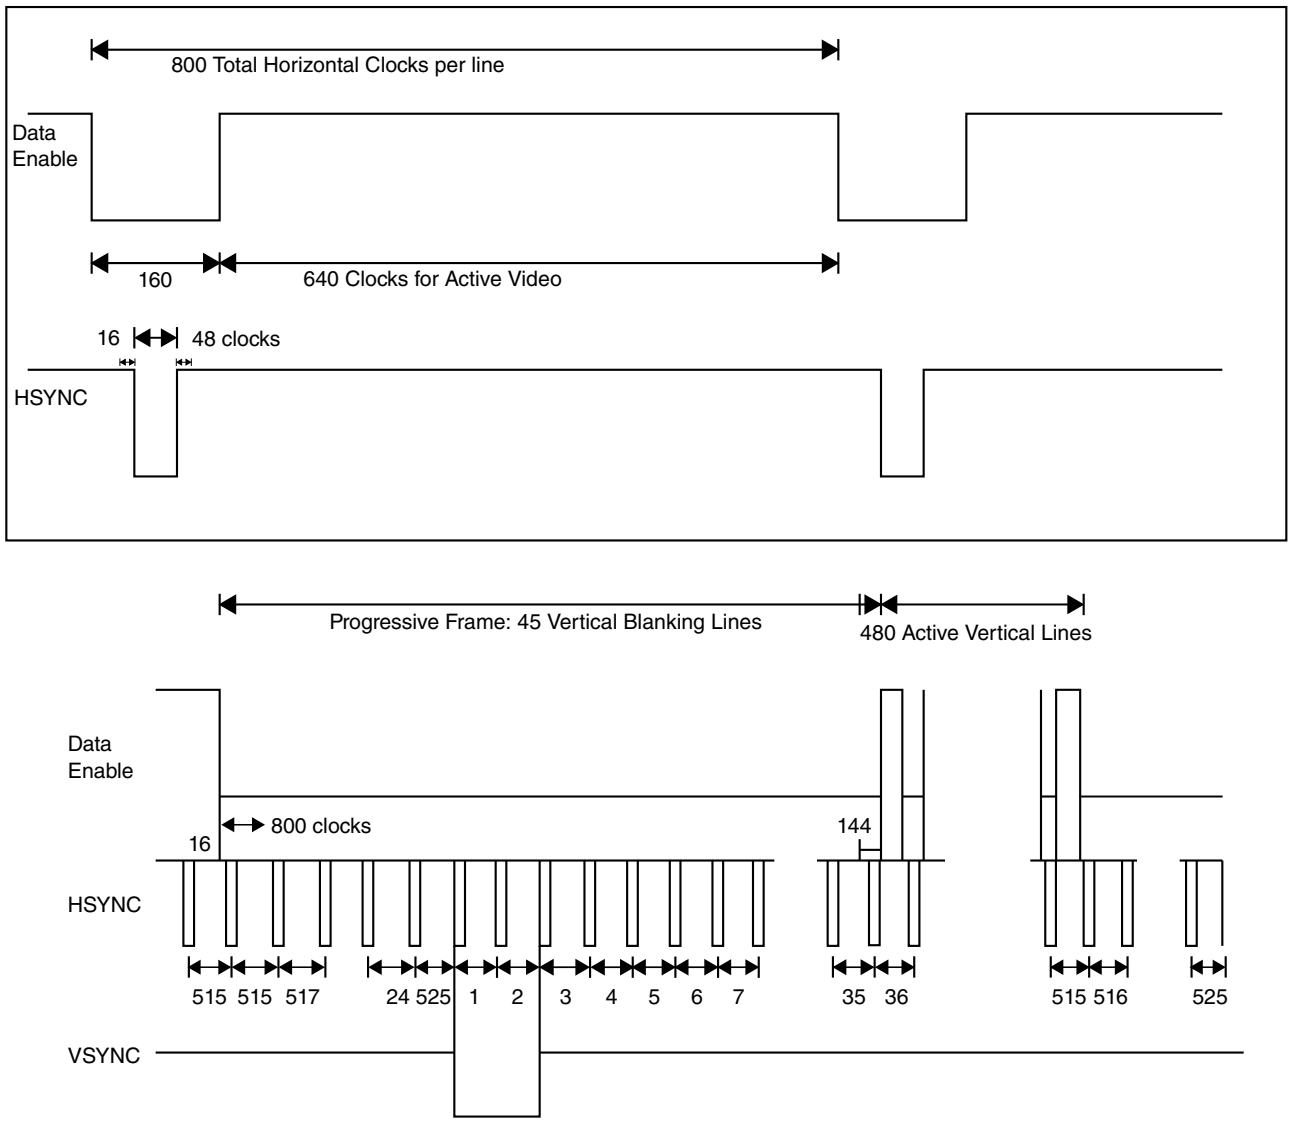

Figure 33-4. Timing Parameters for 640x480p @ 59.94/60 Hz

For a complete list of timing parameters and diagrams, refer to the CEA-861-E specification. The SDR video sample input format is illustrated in the figure below.

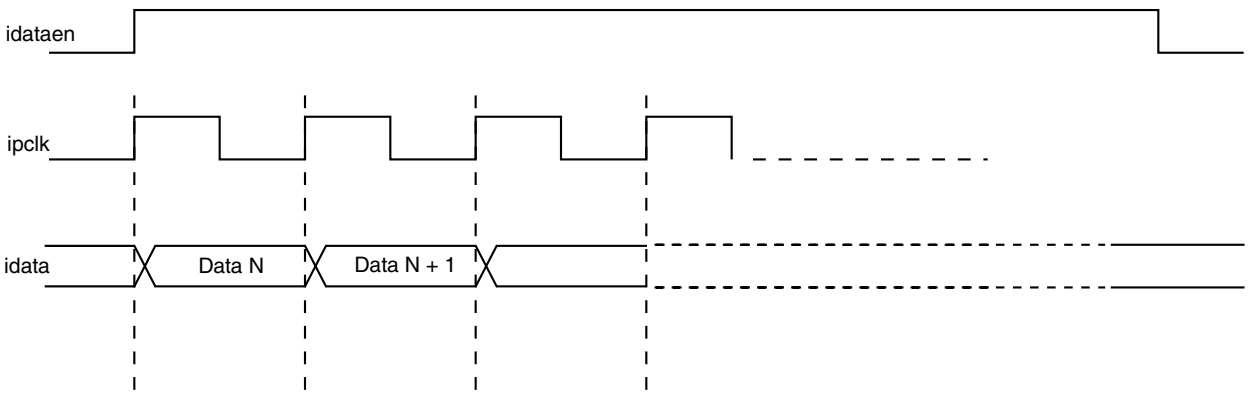

Figure 33-5. Video Sample Timing Interface for RGB and YCbCr SDR Format

33.4.3 Supported Video Mode

The table below shows examples of the supported video modes.

Table 33-3. Video Modes

				2D	3D Structure							
VideoMode	Mode	H x V Active Resolution (pixel)	Refresh Rate (Hz)	2D Pixel Rate (Mp/s)	Frame Packing Pixel Rate (Mp/s)	Field Alt. Pixel Rate (Mp/s)	Line Alt. Pixel Rate (Mp/s)	Side-by-Side (full) Pixel Rate (Mp/s)	L+depth Pixel Rate (Mp/s)	L+depth+graphics+graphics-depth Pixel Rate (Mp/s)	Side-by-Side (Half) Pixel Rate (Mp/s)	Top-and-Bottom Pixel Rate (Mp/s)
					ALL CEA	Interlaced Only	Progr. Only	ALL CEA	Progr. Only	Progr. Only	ALL CEA	ALL CEA
Primary HDMI Video Format Timings (CEA-861-E)

33.4.4 Video Packetizer

This block is responsible for:

- Pixel repetition (if not already performed in the input video stream and needed by the user)
- 10-bit, 12-bit, and 16-bit packing when in deep color modes
- YCC 422 remapping according to the HDMI 1.4a specification
- Clock rate transformation from pixel or repetition clock to the final TMDS clock domain (by means of FIFOs)

The figure below depicts a functional diagram of the Video Packetizer block.

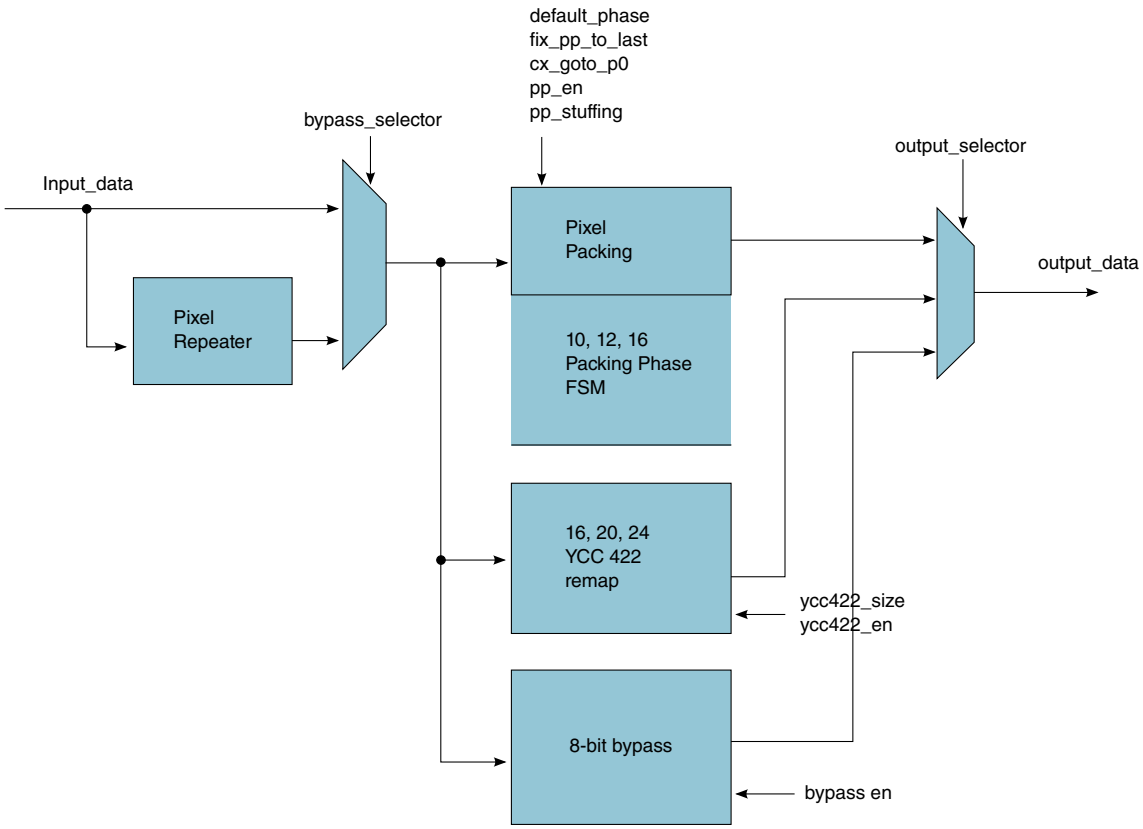

Figure 33-6. Video Packetizer Functional Diagram

33.4.5 Color Space Conversion

This block is responsible for carrying out the following video color space conversion functions:

- RGB to/from YCbCr
- 4:2:2 to/from 4:4:4 up (pixel repetition or linear interpolation)/down-converter
- Limited to/from full quantization range conversion

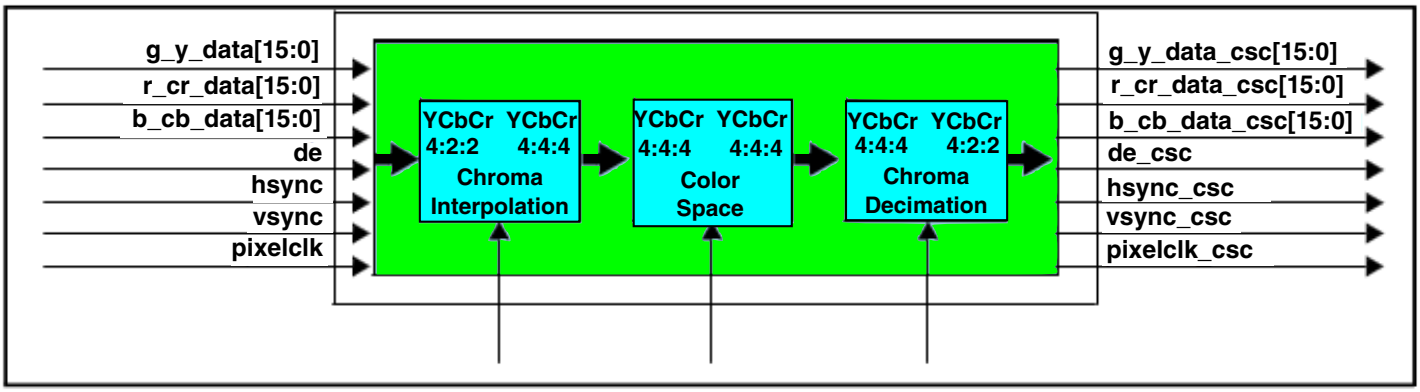

Figure 33-7. Color Space Converter Simplified Block Diagram

The Color Space Converter (CSC) supports all the timings reported in the CEA-861-D specification and the following pixel modes:

- RGB444 and YCbCr444: 24, 30, 36, and 48 bits
- YCbCr422: 16, 20, and 24 bits

The color space conversion matrix is ruled by the following equations listed below. The color space conversion registers base address is 0x4100.

$$out_1 = (X_1 \times in_1 /4096 + X_2 \times in_2 /4096 + X_3 \times in_3 /4096 + X_4) \times 2^{scale}$$

$$out_2 = (Y_1 \times in_1 /4096 + Y_2 \times in_2 /4096 + Y_3 \times in_3 /4096 + Y_4) \times 2^{scale}$$

$$out_3 = (Z_1 \times in_1 /4096 + Z_2 \times in_2 /4096 + Z_3 \times in_3 /4096 + Z_4) \times 2^{scale}$$

33.4.6 Audio Interfaces

The supported audio input interfaces are:

- AHB Direct Memory Access (DMA)

No lipsync support is available inside the HDMI TX. If necessary, this feature can be performed at the system audio processor side. From the HDMI TX, no audio/video delay or skew is added.

The audio sampler registers base address is 0x3100.

33.4.6.1 CTS Calculation

Because there is no audio clock carried through the HDMI link, only the pixel clock is used.

The CTS/N has to be set by software with value taken in the following table. Table below shows the CTS and N value for the supported standard. All other TMDS clocks are not supported; the TMDS clocks divided or multiplied by 1,001 coefficients are not supported.

Table 33-4. N and CTS for 8-Bit Color Depth

	TMDS Clock (MHz)											
	25.2		27		54		74.25		148.5		297	
Fs (kHZ)	N	CTS	N	CTS	N	CTS	N	CTS	N	CTS	N	CTS
32	4096	25200	4096	27000	4096	54000	4096	74250	4096	148500	3072	222750
44.1	6272	28000	6272	30000	6272	60000	6272	82500	6272	165000	4704	247500
48	6144	25200	6144	27000	6144	54000	6144	74250	6144	148500	5120	247500
88.2	12544	28000	12544	30000	12544	60000	12544	82500	12544	165000	9408	247500
96	12288	25200	12288	27000	12288	54000	12288	74250	12288	148500	10240	247500
176.4	25088	28000	25088	30000	25088	60000	25088	82500	25088	165000	18816	247500
192	24576	25200	24576	27000	24576	54000	24576	74250	24576	148500	20480	247500
768	Used for HBR audio only. N and CTS configured for Fs=192kHZ (1/4th ACR value per spec)											

To support the deep color mode and/or 3D video modes, the TMDS clock is multiplied by 4, 2, 1.5, or 1.25, depending on the mode. In this case, the CTS value must also follow the same ratio.

33.4.6.2 Audio DMA Interface

This audio direct memory access (DMA) interface is intended for advanced systems running 32-bit CPU SoC solutions.

This module provides a direct audio DMA interface, which is useful in systems where a DSP handles audio processing. In these systems, sending the incoming audio samples directly to the memory provides a cleaner architecture to the SoC, without the overhead of converting several audio standards.

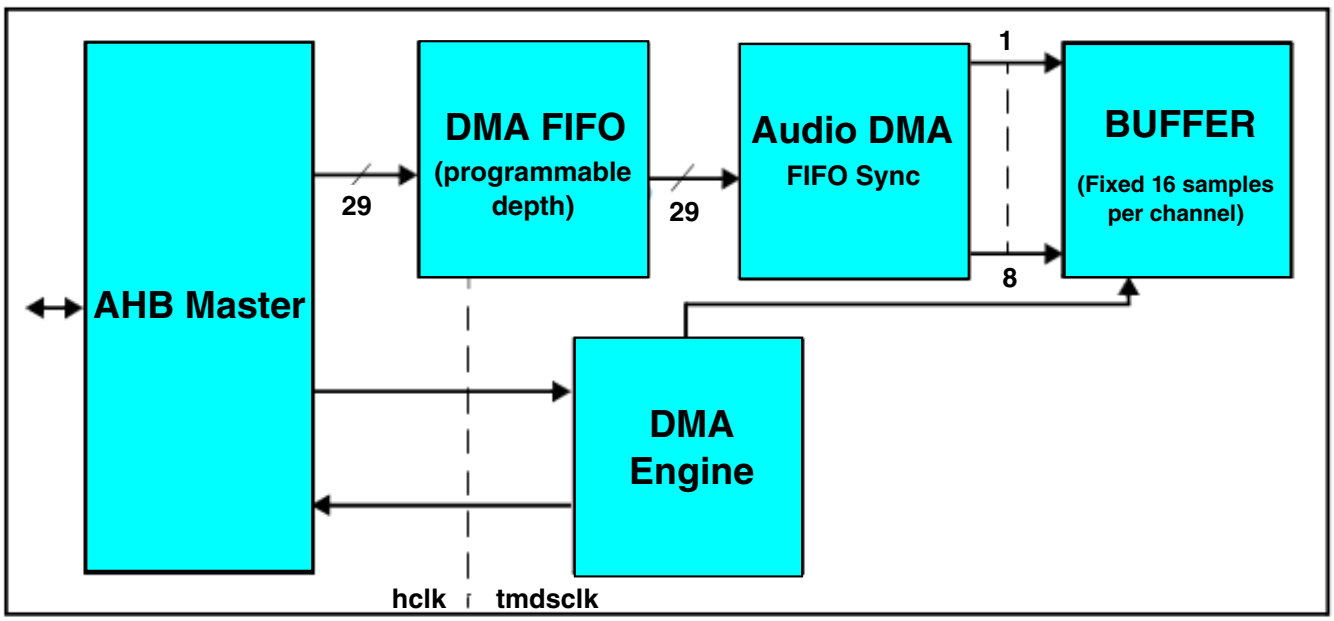

Figure 33-8. Audio DMA Block Diagram

The audio DMA block combines an AHB master interface with a FIFO to perform direct memory access to audio samples stored in a system memory.

The DMA engine is configurable through programmable software registers to perform autonomous burst reading on a configured memory range.

33.4.6.2.1 AHB Master

The AHB master is compliant with the AMBA AHB Specification, Revision 2.0 from ARM.

It has the following features:

- Multi-master capable operation
- 32-bit data transfer
- OKAY, ERROR, RETRY, and SPLIT slave responses
- Rescheduling of burst requirements
- IDLE, NONSEQ, and SEQ transfer types
- Incremental burst modes: unspecified lengths (upper limit is 1 kB boundary) and INCR, INCR4, INCR8, and INCR16 fixed-beat bursts
- Master burst lock mechanism

- Bus access granting
- The following features are not supported:
- Write transaction
- Protection control
- BUSY transfer type
- Wrapping burst

Data Organization in System Memory

The AHB master block fetches the samples from system memory. The Audio Samples are organized according to the channel allocation.

For example, channel 0, 1, 3, 5 are enabled (0 and 1 are always enabled). The Audio Samples must be organized in the system memory like the following:

Table 33-5. Audio Sample Arrangement in System Memory

Position	Sample	Channel
0	n-1	0
1	n-1	1
2	n-1	3
3	n-1	5
4	n-1	0
5	n-1	1
6	n-1	3
7	n-1	5
...	...	...

Table 33-6. Data Arrangement in System Memory for L-PCM (24 bits)

Bit	Description
28	B - IEC B bit
27	P - Parity bit
26	C - Channel Status bit
25	U - User Data bit
24	V - Validity Bit
[23:0]	Audio Sample Data

Table 33-7. Data Arrangement in System Memory for L-PCM (16 bits) and NL-PCM (16 bits)

Bit	Description
28	B - IEC B bit
27	P - Parity bit
26	C - Channel Status bit

33.4.6.2.2 DMA Engine

The DMA engine is responsible for requesting burst transfers to the AHB master, taking into account the FIFO threshold and register settings.

33.4.6.2.2.1 Functional Behavior

The engine:

- Arbitrates read requests to start the burst in the initial address with the size sufficient to fill the FIFO (the size of the FIFO is a parameter in the audio DMA core).
- After this first request, the DMA engine performs subsequent burst requests (incrementing accordingly ohaddr[31:0] and determining correct ohburst[2:0]) towards final_addr[31:0] configured at the register bank and taking into account the AUDIO_FIFO_DEPTH parameter and fifo_threshold[7:0] configuration.
- In the burst mode (INCR4, INCR8, INCR16), the operation stops at the end of the burst.
- Stops operation upon ERROR slave response, signaling ointerror interrupt and staterror signal
- Continues burst transaction:
- Upon RETRY/SPLIT slave response, signaling ointretrysplit interrupt and statretrysplit signal
- Upon losing ownership (no ihgrant) as consequence of arbiter action, signaling ointlostownership interrupt and statlostownership signal
- Decides through register configuration which burst method (unspecified length incrementing or fixed beat incrementing) to use in the read transfers
- Issues ointdone interrupt when it reaches final address reading or is stopped upon user request
- Automatically starts new burst requests until the final_addr[31:0] is reached
- The DMA engine is either stopped by the user or an error/fail condition appears at the slave response.
- Takes into account that an incrementing burst can be of any length (if unspecified INCR type), but upper limit is set because the address must not cross a 1kB boundary

- A maximum theoretical length of a burst is 1024. The burst size must be declared on the mburstlength_addr[10:0].
- Has INCR with an unspecified burst as the default operation burst mode

33.4.6.2.2.2 DMA Operation

Normal operation of the DMA engine is as follows:

1. The enable_hlock, incr_type[1:0], burst_mode, fifo_threshold[7:0], initial_addr[31:0], and final_addr[31:0] are configured according to desired DMA operation.

   NOTE

   Configured values have to follow these rules:

   The number of memory positions (between initial_addr and final_addr) has to be a multiple of theactive audio channels.

   The final_addr[31:0] signal is always bigger than the initial_addr[31:0].

2. To start the audio DMA operation, a '1' is written to data_buffer_ready.
3. The DMA engine starts the operation. The first burst transfer is:

```
        ohaddr[31:0] = initial_addr[31:0];
        ohburst[2:0] = INCR;
        mburstlength[10:0] = ((initial_addr[31:0] + AUDIO_FIFO_DEPTH) <=
final_addr[31:0]) ?
        ((AUDIO_FIFO_DEPTH < 1024) ? AUDIO_FIFO_DEPTH : 1024) : (final_addr[31:0] -
initial_addr[31:0]);
```

4. While DMA is reading samples from the AHB master and writing samples to the Audio FIFO, a datafetch request from the internal frame composer block might happen at the Audio FIFO interface, diminishing the number of samples in the FIFO.
5. When the number of samples in the Audio FIFO is lower than the configured fifo_threshold[7:0], the DMA engine requests a new burst request to the AHB master interface with:

```
ohaddr[15:0] = last address in step 5);

ohburst[2:0] = INCR;

mburstlength[10:0] = AUDIO_FIFO_DEPTH - fifo_threshold[7:0];
```

6. Steps 4) and 5) continue until the final_addr[31:0] is reached.

NOTE

In the last burst request, the DMA engine calculates the mburstlength[10:0] such that the last requested read position is the final_addr[31:0].

7. After completion of the DMA operation, the DMA engine issues the ointdone interrupt signaling end of operation.

Variations of the DMA engine's behavior occur when fixed-beat, incremental bursts are used by INCR4/INCR8/INCR16 burst selects. When this forcing mode is used, you must correctly configure the FIFO's threshold such that the last of the consecutive INCRx (with x = 4, 8, or 16) bursts correctly fill the FIFO at last burst received. Note there is a re-alignment at the 1k boundary.

The following are exceptions to the described DMA behavior:

1. When a user requests end stop_dma_transaction, the DMA engine stops at the end of the current burst operation and signals its completion with an ointdone interrupt.
2. When the AHB slave sends an error response, the DMA engine stops the current operation and signals ointerror interrupt.

Rules for Configuration of Address Registers:

1. Configure the last 2 bits of initial_addr with 0.

```
For example, 32'h0000_0000.
```

2. Configure the last 2 bits of final_addr with non-zero values.

```
For example
32'hxxx_xxx3 or
32'hxxx_xxx7 or
32'hxxx_xxxB or
32'hxxx_xxxF
Where x= any value
```

3. The number of samples is calculated by using the following formula:

```
Number of samples = (final_addr - initial_addr + 1) / 4
Therefore, final_addr = (Number of samples x 4) + initial_addr -1
If a defined length burst is used, align initial_addr, final_addr and
fifo_threshold with the value. If
the burst is not aligned, DMA uses AHB INCR transfers when required.
```

```
Then the number of samples = 100 (a multiple of 5)
```

4. The threshold must be

```
Greater than the selected FIFO DEPTH;

Greater than the number of channels enabled in channel allocation.
```

Due to the limit of audio DMA design, some registers configuration are updated by SDMA (Smart Direct Memory Access). SDMA need to do these items below:

1. clear the audio DMA done request(actually it's an interrupt); set offset 0x00120109 -- bit2.
2. configure next audio DMA start address(offset 0x00123604~0x00123607) and next stop address(offset 0x00123608~0x0012360b); Start address and stop address are provided by S/W and it's variable.
3. Set offset 0x00123601 – bit0 "1" to start DMA;

33.4.6.2.2.3 Transfer Data, Package, and Word

One transfer data can be composed of several transfer packages, and one transfer package can be composed of one or several transfer bursts. One transfer burst can be composed of several transfer words.

The figure below shows the transfer data structure for a fixed-beat, incremental burst.

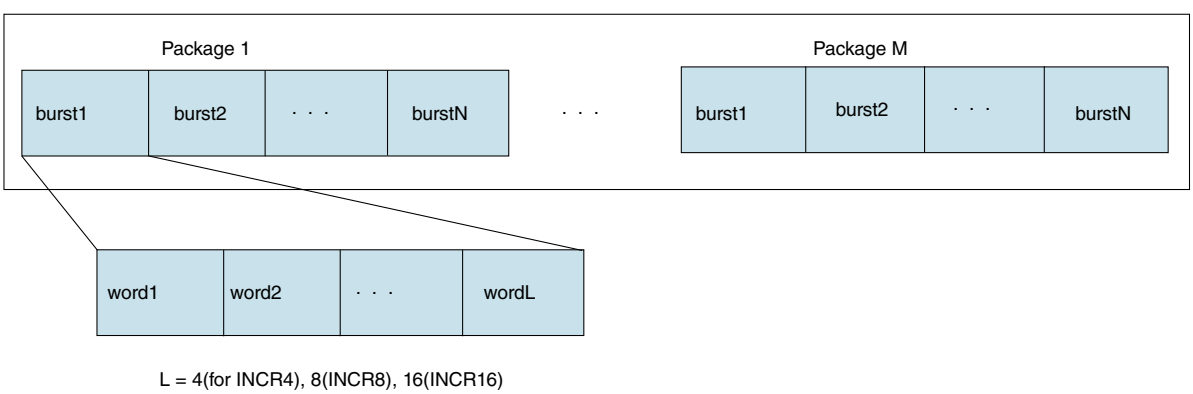

Figure 33-9. Transfer Data Constitution for Fixed-Beat, Incremental Burst

The figure below depicts the transfer data structure for an unspecified burst length.

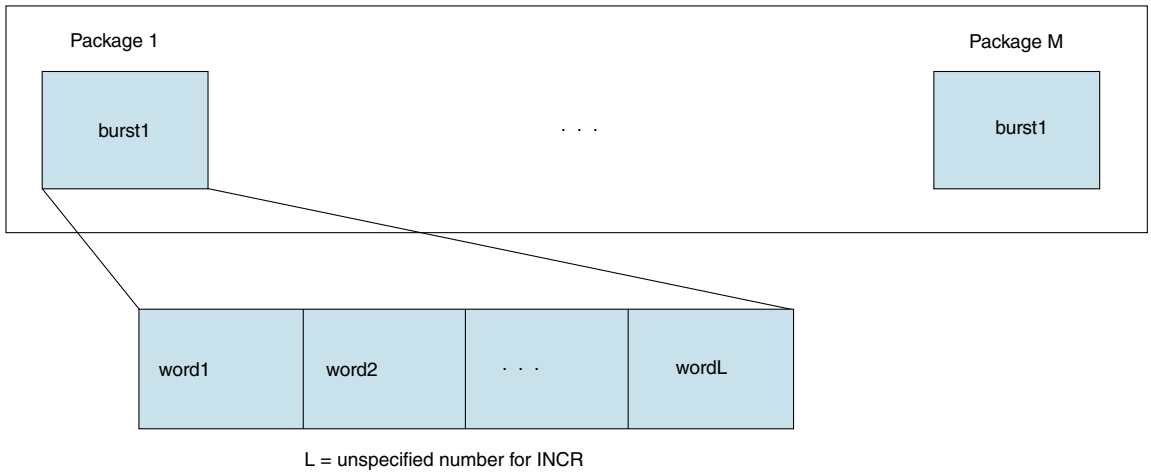

Figure 33-10. Transfer Data Constitution for Unspecified Burst Length

The figure below illustrates the DMA state machine.

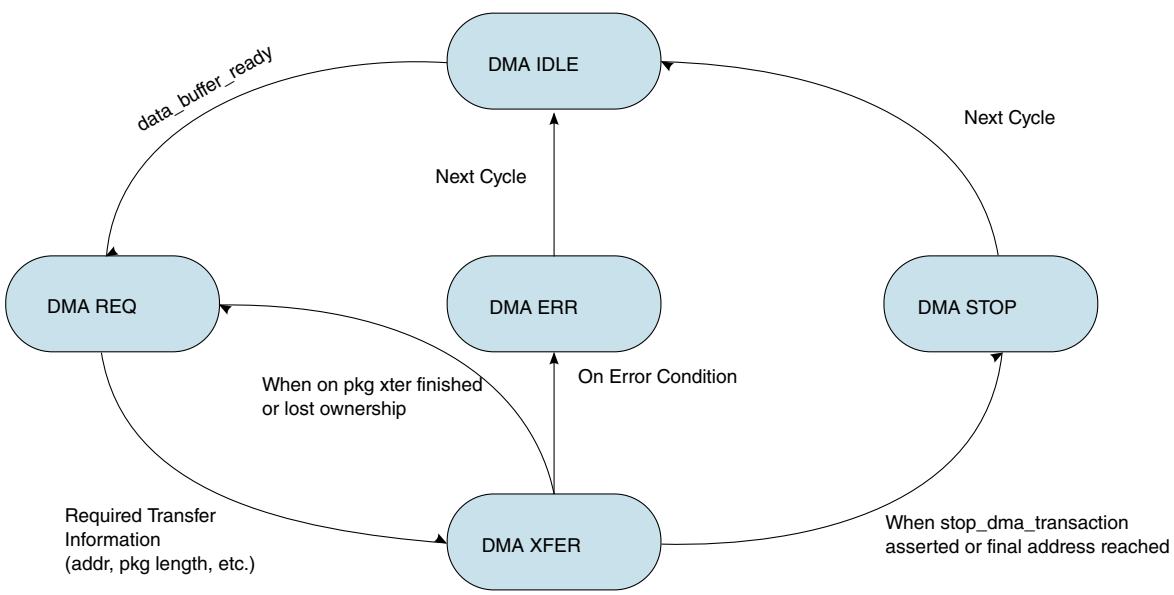

Figure 33-11. DMA FSM Diagram

1. When the operation request is written into the data_buffer_ready, the state switches from IDLE to DMAREQ.
2. When enough transfer information is ready, the state changes to DMAXFER.

3. When one package is completed-indicated by "OnePackOver"-or a lost ownership occurs, the state jumps back to DMAREQ, so the new transaction information can be calculated.
4. When the DMA is ready again, it jumps to DMAXFER.

The previous steps continue until you request an end operation or until the whole operation is completed.

33.4.6.2.3 Audio FIFO

This block contains a FIFO with a configurable depth.

The statthrfiffoempty flag is a version of the FIFO empty, that is active whenever the amount of samples in the FIFO is smaller than four samples. The AHB_DMA_THRSLD and the statthrfifoempty indicators are different. The AHB_DMA_THRSLD defines the occupation of the FIFO, while statthrfifoempty helps the HDMI TX's Frame Composer in the audio packet composition (required when non-linear audio is being packed, in which case four pair of samples are needed to compose one packet).

33.4.6.2.4 FIFO Occupancy/FIFO Almost Empty Flags

The FIFO depth is configured by setting the AUDIO_FIFO_DEPTH parameter in coreConsultant. The FIFO occupancy is calculated from the pointer values.

Also, the most significant pointer bits are used to perform the following calculation:

```
        occupancy = wrptr[n-1:0] - rdptr_previous[n-1:0], if wrptr > rdptr_previous

        occupancy = AUDIO_FIFO_DEPTH + wrptr[n-1:0] - rdptr_previous[n-1:0], if wrptr <
rdptr_previous
```

If occupancy is less than 4, then statthrfifoempty is active.

An example of full/empty flags and FIFO occupancy is shown in the figure below.

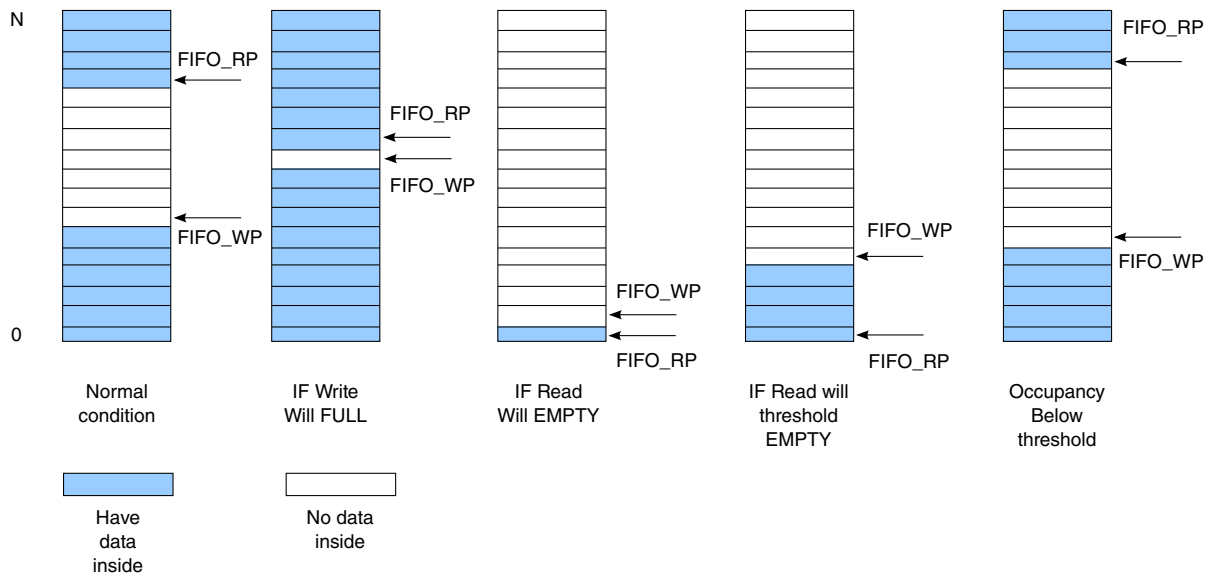

Figure 33-12. Audio FIFO Status Indication

33.4.7 Supported Audio Formats

The HDMI TX has several audio interfaces and each of them has different audio format support capabilities.

Table below represents the audio interface and format dependencies.

Table 33-8. Supported Audio Formats

Audio Input Interface	Audio Format Supported
Audio DMA	Up to eight channels L-PCM/NL-PCM and HBR audio, allowing all audio formats listed to support one single audio DMA interface.

33.4.8 Frame Composer

This block is responsible for assembling video, audio, and data packets in a consistent frame that are streamed to the HDCP cipher and then finally to the HDMI TX PHY.

The HDMI 1.3a standard precisely describes the packet insertion timing and distribution that must be followed to correctly compose an HDMI TMDS (transition minimized differential signaling) stream. In this context, there are data island packets that-when available (ready for insertion in output stream)-have higher priority over others. Two packet descriptor queues are responsible for prioritizing packet insertion.

The higher priority packets are described in Table below. These packets are inserted in the output stream as soon as data to compose them is available (see the HDMI 1.3a standard).

Table 33-9. High Priority Data Island Packets

Packet	Description
Audio Clock Regeneration (ACR)	Indicates to sink device the N/CTS values that should be used in the ACR process
Audio Sample (AUDS)	Transports L-PCM and IEC 61937 compressed audio
General Control (GCP)	Indicates Color Depth, Pixel Packing phase, and AV mute information to sink device

The packets described in tables below can be considered as low priority packets-even though they have precise timing insertion-because their insertion timing is large (for example, one per frame or one per two frames without specific location for some of the packet types and on user request transmit for others).

Table 33-10. Low Priority Data Island Packets

Packet	Description
Audio Content Protection (ACP)	Used to convey content-related information about the active audio stream transmitted
Audio InfoFrame (AUDI)	Indicates characteristics of the active audio stream by using IEC 60958 channel status bits, IEC 61937 burst info, and/or stream data (if present).
Null (NULL)	Ignored by sink devices.
International Standard Recording Code (ISRC1/ISRC2)	See HDMI 1.3a section 5.3.8.
Vendor Specific (VSD) InfoFrame	According to CEA-861-E standard.
AVI infoFrame (AVI)	Video information from source to sink.
Source Data Product Descriptor (SPD) infoFrame	Name and product type of the source device. MPEG (MPEG) Source InfoFrame packets (optional, implementation discouraged by CEA-861-E Section 6.7). Describes several aspects of the compressed video stream that were used to produce the uncompressed video.

The Frame Composer distributes and assembles the data island packets according to the module register bank configuration. The block allows extended control periods to appear with a certain programmed spacing. The Frame Composer uses two packet buffers that allow a packet to be composed while another is being sent to the output HDMI stream.

Packet requests are inserted into the packet queues by a data island flexible scheduler. The HDMI 1.3a specification requires that packet distribution and insertion timing correctly compose an output HDMI TMDS stream. In this context, there are data island packets that are sent on data availability, while others are sent once per frame or once per two frames. and finally others that are sent on user request. Classification of the packets according to this insertion timing is described in the table below.

Table 33-11. Packet Classification

Packet	Classification
Audio Clock Regeneration (ACR)	Sent on data availability.
Audio Sample (AUDS)	Sent on data availability (precede ACR if present).
Audio Content Protection (ACP)	On user request or automatic insertion.
Audio InfoFrame (AUDI)	Once per two frames.
Null (NULL)	On user request or automatic insertion to fill Data Island period.
General Control (GCP)	Once per frame.
International Standard Recording Code (ISRC1/ ISRC2)	On user request.
Vendor Specific (VSD) InfoFrame	On user request or automatic insertion.
AVI infoFrame (AVI)	Once per frame.
Source Data Product Descriptor (SPD) infoFrame	On user request or automatic insertion.

The Data Island Scheduler (DIS) handles packet distribution in the Frame Composer. The DIS is a round- robin (RDRB) state machine that is able to schedule packet insertion on an input video frame or line basis. The DIS is fully configurable and can schedule any packet type to be inserted at a given input video frame rate or input video line rate.

While determining packet distribution on an input video frame or line basis, the DIS schedules the packets to be inserted in the output HDMI stream by inserting the packet descriptor in the corresponding packet priority queue, according to packet priority classification.

After the packet descriptor has been inserted in the packet priority queues, the Data Island Packer (DIP) is responsible for assembling and sequencing the packets for output HDMI stream insertion.

Dedicated ECC generators and checksum byte-wide sum hardware generate the BCH ECC parity codes and infoFrames checksums for all the data islands packets.

The content of GCP, ISRC1/2, VSD, AVI, SPD, and MPEG packets are configured through the registers bank starting at address 0x1000.

33.4.9 HDCP Encryption Engine

HDCP is designed to protect the transmission of audio-visual content between an HDCP Transmitter and an HDCP Receiver.

The system also allows for HDCP Repeaters that support downstream HDCP-protected interface ports. The HDCP system allows up to seven levels of HDCP Repeaters and as many as 128 total HDCP devices, including HDCP Repeaters, to be attached to an HDCP-protected interface port.

NOTE

This feature must be configured and requires a separate license. Contact your Freescale representative for more information on HDCP.

The authentication protocol enables the HDCP Transmitter to verify that a given HDCP Receiver is licensed. With the legitimacy of the Receiver determined, encrypted HDCP content is transmitted between the two based on shared secrets established during authentication. In the event that legitimate devices are compromised to permit unauthorized use of the content, renewability allows an HDCP Transmitter to identify such compromised devices and prevent the transmission of the content.

The implemented HDCP functionality is compliant with HDCP revision 1.4. The HDCP transmitter implements the three layers of the HDCP cipher, including LFSR and other functions required to generate the encryption key bytes that are then XORed with the data.

33.4.10 EDID/HDCP I^2C E-DDC Interface

The E-DDC channel is a dedicated I2C master interface that allows the read of sink E-EDID based on system needs.

Data read from sink E-EDID can be then transferred to the I2C Master register bank, starting at address 0x7E00.

This block reads the E-EDID (and all its segments according to user configuration) and, after completion, it warns the CPU of data availability. This block also arbitrates the I2C master interface to allow the HDMI TX's HDCP authentication protocol to be performed through this interface. Sink HDCP links (with addresses 0x74 and/or 0x76) should be present at these lines to enable HDCP-compliant behavior.

The interface is shared with the DDC channel of the HDMI controller through multiplexers and is I2C compliant.

33.4.10.1 I²C Master Interface Normal Mode

This operation implements a single read or write operation using the Special Function Register configuration.

The I²C data transfer protocol used is the 7-bit addressed, as defined in Section 9 of the I²C-bus Specification, version 2.1.

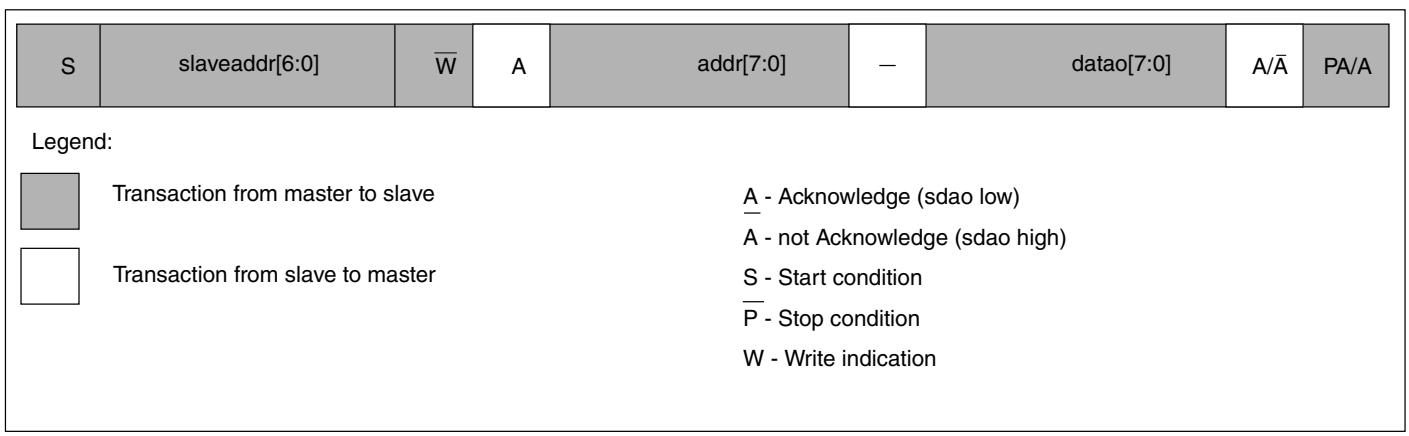

Figure 33-13. Data Write Transaction

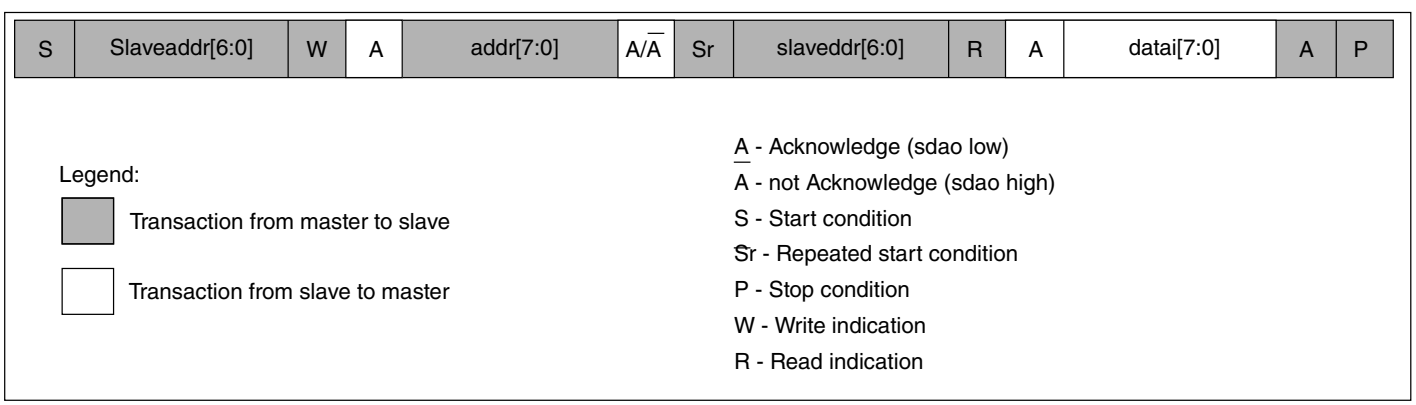

Figure 33-14. Data Read Transaction

33.4.10.2 I²C Master Interface Extended Read Mode

This I2C extended read mode operation implements a segment pointer-based read operation using the Special Register configuration.

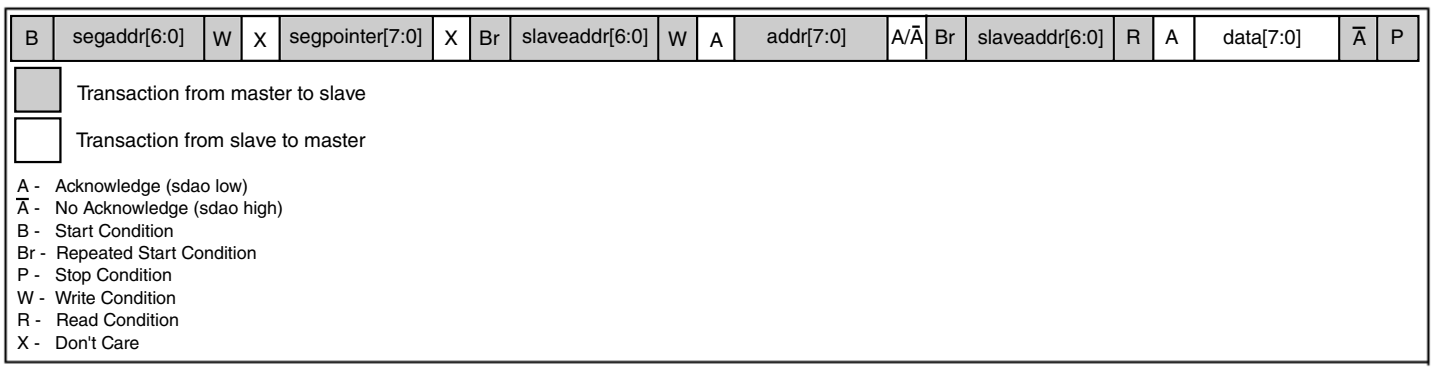

Figure 33-15. Extended Data Read Operation

33.4.11 System Configuration Interfaces

The internal register set is distributed with the HDMI TX. The system interface (the interface that connects to the processor bus) bridges these registers using a simple standard interface.

The system interface is AMBA AHB,.

The AHB bridges the bus to the internal SFR bus.

33.4.11.1 AMBA AHB Slave Interface

The AMBA AHB slave interface is compatible with the AMBA Specification, revision 2.0.

The AHB slave interface is used for register configuration implementing only a simple transaction mode and single master slave operation.

The HDMI TX does not support protection control, burst transfers, or split transactions.

33.4.12 CEC Hardware Engine

Consumer Electronics Control (CEC) is a protocol that provides high-level control functions between all of the various audiovisual products in a user's environment.

It is an optional feature in the HDMI 1.3a Specification. It uses only one bidirectional line for transmission and reception.

All transactions on the CEC line consist of an initiator and one or more followers. The initiator is responsible for sending the message structure and the data. The follower is the recipient of any data and is responsible for setting any acknowledgement bits.

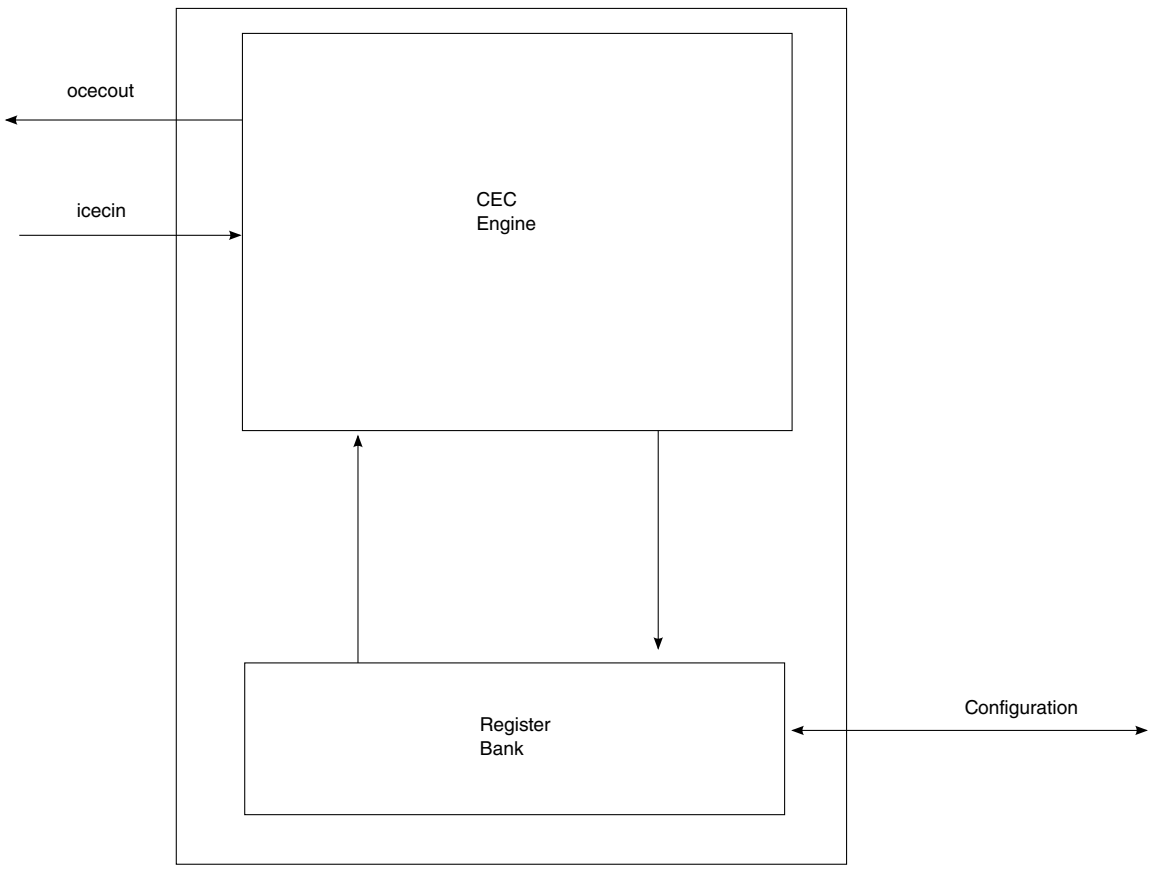

Figure 33-16. CEC Engine Simplified Block Diagram

There are two operation modes for a CEC controller.

- Initiator Mode
- In this mode, the CEC controller sends messages out and waits for a follower to feedback. The CEC controller works in this mode when it starts to send a frame. After the transmission is done, it automatically returns to the follower mode (no software control involved).

- Follower Mode
- In this mode, the CEC controller receives messages and feeds back the initiator with appropriate signals. The CEC controller always works in the follower mode whenever it is not transmitting any data.

For correct CEC controller interface operation, initial reset is required in order to set internal registers to a known state. After this reset, the interface is in an IDLE state, waiting for a read or write request coming from the register configuration.

A specific CEC API is provided that implements all necessary low-level register configuration to send and receive CEC messages. For more information, see the CEC API documentation.

The CEC engine registers base address is 0x7D00. For more information about these registers, see HDMI Memory Map/Register Definition.

For more information about CEC, see *Consumer Electronics Control (CEC) Application Note*.

33.5 HDMI Memory Map/Register Definition

All registers are addressable on 32-bit boundaries; each unused bit or address location is reserved for future use and read back as 0.

.

33.5.1 Design Identification Register (HDMI_DESIGN_ID)

The following are the registers used to identify the HDMI TX controller.

- Name: Design Identification Register
- Address Offset: 0x0000
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 0h offset = 12_0000h

Bit	7	6	5	4	3	2	1	0
Read	DESIGN_ID							
Write								
Reset	0	0	0	0	0	0	0	0

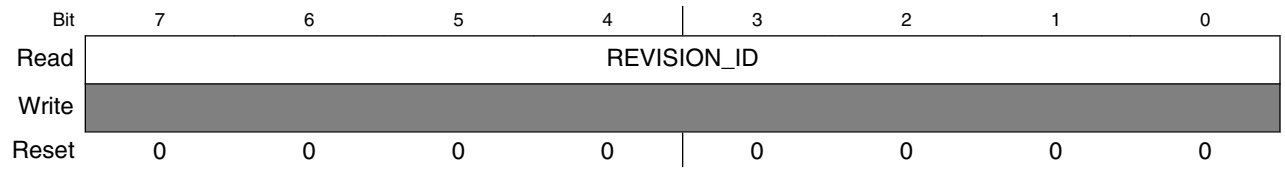
HDMI_DESIGN_ID field descriptions

Field	Description
DESIGN_ID	This is a 1 byte design ID code fixed by Freescale that Identifies the main revision of the HDMI TX controller. For example, HDMI TX 1.30a, DESIGN_ID = 11h; REVISION_ID = 0Ah

33.5.2 Revision Identification Register (HDMI_REVISION_ID)

- Name: Revision Identification Register
- Address Offset: 0x0001
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 1h offset = 12_0001h



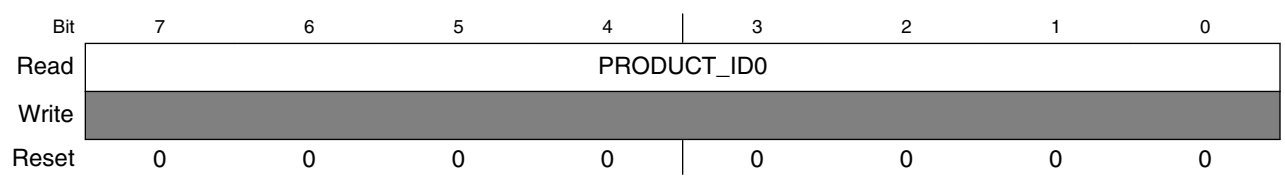
HDMI_REVISION_ID field descriptions

Field	Description
REVISION_ID	This is a one byte revision ID code fixed by Freescale that Identifies the main revision of the HDMI TX controller. For example, HDMI TX 1.30a, DESIGN_ID = 12h; REVISION_ID = 0Ah

33.5.3 Product Identification Register 0 (HDMI_PRODUCT_ID0)

- Name: Product Identification Register 0
- Address Offset: 0x0002
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 2h offset = 12_0002h



HDMI_PRODUCT_ID0 field descriptions

Field	Description
PRODUCT_ID0	This one byte fixed code Identifies Freescale's product line ("A0h" for HDMI TX products).

33.5.4 Product Identification Register 1 (HDMI_PRODUCT_ID1)

- Name: Product Identification Register 1
- Address Offset: 0x0003
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 3h offset = 12_0003h

Bit	7	6	5	4	3	2	1	0
Read	PRODUCT_ID1							
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_PRODUCT_ID1 field descriptions

Field	Description
PRODUCT_ID1	This one byte fixed code identifies Freescale's product line according to: 01h HDMI TX Controller C1h HDMI TX Controller with HDCP encryption engine

33.5.5 Configuration Identification Register 0 (HDMI_CONFIG0_ID)

- Name: Configuration Identification Register 0
- Address Offset: 0x0004
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 4h offset = 12_0004h

Bit	7	6	5	4	3	2	1	0
Read	prepen	audhbr	audspdif	audi2s	hdmi14	csc	cec	hdcp
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_CONFIG0_ID field descriptions

Field	Description
7 prepen	Indicates if it is possible to use internal pixel repetition
6 audhbr	Indicates if HBR interface is present
5 audspdif	Indicates if SPDIF interface is present
4 audi2s	Indicates if I2S interface is present
3 hdmi14	Indicates if HDMI 1.4 features are present
2 csc	Indicates if Color Space Conversion block is present
1 cec	Indicates if CEC is present
0 hdcp	Indicates if HDCP is present

33.5.6 Configuration Identification Register 1 (HDMI_CONFIG1_ID)

- Name: Configuration Identification Register 1
- Address Offset: 0x0005
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 5h offset = 12_0005h

Bit	7	6	5	4	3	2	1	0
Read	Reserved			confsfrdir	confi2c	confocp	confapb	confahb
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_CONFIG1_ID field descriptions

Field	Description
7–5 -	This field is reserved.
4 confsfrdir	Indicates that configuration interface is SFR interface
3 confi2c	Indicates that configuration interface is I2C interface

Table continues on the next page...

HDMI_CONFIG1_ID field descriptions (continued)

Field	Description
2 confocp	Indicates that configuration interface is OCP interface
1 confapb	Indicates that configuration interface is APB interface
0 confahb	Indicates that configuration interface is AHB interface

33.5.7 Configuration Identification Register 2 (HDMI_CONFIG2_ID)

- Name: Configuration Identification Register 2
- Address Offset: 0x0006
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 6h offset = 12_0006h

Bit	7	6	5	4	3	2	1	0
Read	phytype							
Write								
Reset	0	0	0	0	0	0	0	0

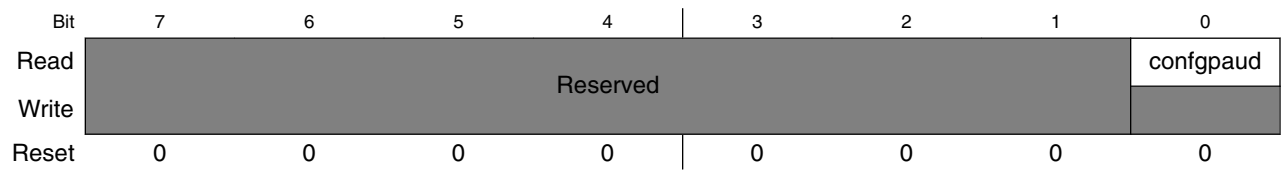
HDMI_CONFIG2_ID field descriptions

Field	Description
phytype	Indicates the type of PHY interface selected: 00h Legacy PHY (HDMI TX PHY) F2h PHY_Gen2 (HDMI 3D TX PHY) E2h PHY_Gen2 (HDMI 3D TX PHY) + HEAC PHY

33.5.8 Configuration Identification Register 3 (HDMI_CONFIG3_ID)

- Name: Configuration Identification Register 3
- Address Offset: 0x0007
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12_0000h base + 7h offset = 12_0007h



HDMI_CONFIG3_ID field descriptions

Field	Description
7–1 -	This field is reserved.
0 confgpaud	Indicates that configuration interface is Generic Parallel Audio (GPAUD) interface

33.5.9 Frame Composer Interrupt Status Register 0 (HDMI_IH_FC_STAT0)

This section describes clear on write (1 to corresponding bit) status registers, which contain the following active-high, sticky bit interrupts.

HDMI TX introduces a new set of sticky bit mute control registers (IH_MUTE_FC_STAT0 to IH_MUTE_AHBDMAAUD_STAT0) that correspond to the interrupt registers. You can ignore a sticky bit interrupt by setting the corresponding mute control register bit to 1. This puts the global interrupt line on a higher priority than the sticky bit interrupt.

- Address Offset: 0x0100
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 100h offset = 12_0100h

Bit	7	6	5	4	3	2	1	0
Read	AUDI	ACP	HBR	DST	OBA	AUDS	ACR	NULL
Write	w1c	w1c	w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

HDMI_IH_FC_STAT0 field descriptions

Field	Description
7 AUDI	Active after successful transmission of an Audio InfoFrame packet.
6 ACP	Active after successful transmission of an Audio Content Protection packet.
5 HBR	Active after successful transmission of an Audio HBR packet.
4 DST	Reserved
3 OBA	Reserved
2 AUDS	Active after successful transmission of an Audio Sample packet. Due to high number of audio sample packets transmitted, this interrupt is by default masked at frame composer.
1 ACR	Active after successful transmission of an Audio Clock Regeneration (N/CTS transmission) packet.
0 NULL	Active after successful transmission of an Null packet. Due to high number of audio sample packets transmitted, this interrupt is by default masked at frame composer.

33.5.10 Frame Composer Interrupt Status Register 1 (HDMI_IH_FC_STAT1)

- Address Offset: 0x0101
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 101h offset = 12_0101h

Bit	7	6	5	4	3	2	1	0
Read	GMD	ISCR1	ISCR2	VSD	SPD	MPEG	AVI	GCP
Write	w1c	w1c	w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

HDMI_IH_FC_STAT1 field descriptions

Field	Description
7 GMD	Active after successful transmission of an Gamut metadata packet.
6 ISCR1	Active after successful transmission of an International Standard Recording Code 1 packet.
5 ISCR2	Active after successful transmission of an International Standard Recording Code 2 packet.
4 VSD	Active after successful transmission of an Vendor Specific Data infoFrame packet.
3 SPD	Active after successful transmission of an Source Product Descriptor infoFrame packet.
2 MPEG	Reserved
1 AVI	Active after successful transmission of an AVI infoFrame packet.
0 GCP	Active after successful transmission of an General Control Packet.

33.5.11 Frame Composer Interrupt Status Register 2 (HDMI_IH_FC_STAT2)

- Address Offset: 0x0102
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 102h offset = 12_0102h

Bit	7	6	5	4	3	2	1	0
Read	Reserved						LowPriority_ overflow	HighPriority _overflow
Write							w1c	w1c
Reset	0	0	0	0	0	0	0	0

HDMI_IH_FC_STAT2 field descriptions

Field	Description
7–2 -	This field is reserved. Reserved
1 LowPriority_ overflow	Frame Composer low priority packet queue descriptor overflow indication.

Table continues on the next page...

HDMI_IH_FC_STAT2 field descriptions (continued)

Field	Description
0 HighPriority_ overflow	Frame Composer high priority packet queue descriptor overflow indication.

33.5.12 Audio Sampler Interrupt Status Register (HDMI_IH_AS_STAT0)

- Address Offset: 0x0103
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 103h offset = 12_0103h

Bit	7	6	5	4	3	2	1	0
Read	Reserved					Aud_fifo_ underflow_ thr	Aud_fifo_ underflow	Aud_fifo_ overflow
Write						w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

HDMI_IH_AS_STAT0 field descriptions

Field	Description
7–3 -	This field is reserved. Reserved
2 Aud_fifo_ underflow_thr	Audio Sampler audio FIFO empty threshold (four samples) indication. Only valid in HBR audio.
1 Aud_fifo_ underflow	Audio Sampler audio FIFO empty indication.
0 Aud_fifo_ overflow	Audio Sampler audio FIFO full indication.

33.5.13 PHY Interface Interrupt Status Register (HDMI_IH_PHY_STAT0)

- Address Offset: 0x0104
- Size: 8 bits
- Value after Reset: 0x00
- Access: Clear on Write/Read

Address: 12_0000h base + 104h offset = 12_0104h

Bit	7	6	5	4
Read	Reserved		RX_SENSE3	RX_SENSE2
Write			w1c	w1c
Reset	0	0	0	0

Bit	3	2	1	0
Read	RX_SENSE1	RX_SENSE0	TX_PHY_LOCK	HDP
Write	w1c	w1c	w1c	w1c
Reset	0	0	0	0

HDMI_IH_PHY_STAT0 field descriptions

Field	Description
7–6 -	This field is reserved. Reserved
5 RX_SENSE3	TX PHY RX_SENSE indication for driver 3. You may need to mask or change polarity of this interrupt after it has become active.
4 RX_SENSE2	TX PHY RX_SENSE indication for driver 2. You may need to mask or change polarity of this interrupt after it has become active.
3 RX_SENSE1	TX PHY RX_SENSE indication for driver 1. You may need to mask or change polarity of this interrupt after it has become active.
2 RX_SENSE0	TX PHY RX_SENSE indication for driver 0. You may need to mask or change polarity of this interrupt after it has become active.
1 TX_PHY_LOCK	TX PHY PLL lock indication. Please refer to PHY datasheet for more information. You may need to mask or change polarity of this interrupt after it has become active.
0 HDP	HDMI Hot Plug Detect indication. You may need to mask or change polarity of this interrupt after it has become active.

33.5.14 E-DDC I2C Master Interrupt Status Register (HDMI_IH_I2CM_STAT0)

- Address Offset: 0x0105
- Size: 8 bits
- Value after Reset: 0x00
- Access: Clear on Write/Read

Address: 12_0000h base + 105h offset = 12_0105h

Bit	7	6	5	4
Read	Reserved			
Write				
Reset	0	0	0	0

Bit	3	2	1	0
Read	Reserved		I2Cmasterdone	I2CMASTER_ERROR
Write			w1c	w1c
Reset	0	0	0	0

HDMI_IH_I2CM_STAT0 field descriptions

Field	Description
7–2 -	This field is reserved. Reserved
1 I2Cmasterdone	I2C Master done indication
0 I2CMASTER_ERROR	I2C Master error indication

33.5.15 CEC Interrupt Status Register (HDMI_IH_CEC_STAT0)

- Address Offset: 0x0106
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 106h offset = 12_0106h

Bit	7	6	5	4	3	2	1	0
Read	Reserved	WAKEUP	ERROR_ FOLLOW	ERROR_ INITIATOR	ARB_LOST	NACK	EOM	DONE
Write		w1c	w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

HDMI_IH_CEC_STAT0 field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 WAKEUP	CEC Wake-up indication
5 ERROR_ FOLLOW	CEC Error_follow indication
4 ERROR_ INITIATOR	CEC Error_follow indication
3 ARB_LOST	CEC Arb_Lost indication
2 NACK	CEC Nack indication
1 EOM	CEC End of Message Indication
0 DONE	CEC Done Indication

33.5.16 Video Packetizer Interrupt Status Register (HDMI_IH_VP_STAT0)

- Address Offset: 0x0107
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 107h offset = 12_0107h

Bit	7	6	5	4
Read	fifofullrepet	fifoemptyrepet	fifofullpp	fifoemptypp
Write	w1c	w1c	w1c	w1c
Reset	0	0	0	0

Bit	3	2	1	0
Read	fifofullremap	fifoemptyremap	fifofullbyp	fifoemptybyp
Write	w1c	w1c	w1c	w1c
Reset	0	0	0	0

HDMI_IH_VP_STAT0 field descriptions

Field	Description
7 fifofullrepet	Video packetizer pixel repeater FIFO full interrupt
6 fifoemptyrepet	Video packetizer pixel repeater FIFO empty interrupt
5 fifofullpp	Video packetizer pixel packing FIFO full interrupt
4 fifoemptypp	Video packetizer pixel packing FIFO empty interrupt
3 fifofullremap	Video packetizer pixel YCC 422 re-mapper FIFO full interrupt
2 fifoemptyremap	Video packetizer pixel YCC 422 re-mapper FIFO empty interrupt
1 fifofullbyp	Video packetizer 8-bit bypass fifo full interrupt
0 fifoemptybyp	Video packetizer 8-bit bypass fifo empty interrupt

33.5.17 PHY GEN2 I2C Master Interrupt Status Register (HDMI_IH_I2CMPHY_STAT0)

This clear on write (1 to corresponding bit) register contains the following active high sticky bit interrupts. That I2C Master PHY is the I2C Master block used to access the PHY I2C Slave.

- Address Offset: 0x0108
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 108h offset = 12_0108h

Bit	7	6	5	4
Read	Reserved			
Write				
Reset	0	0	0	0

Bit	3	2	1	0
Read	Reserved		i2cmphydone	i2cmphyerror
Write			w1c	w1c
Reset	0	0	0	0

HDMI_IH_I2CMPHY_STAT0 field descriptions

Field	Description
7–2 -	This field is reserved. Reserved
1 i2cmphydone	I2C Master PHY done indication
0 i2cmphyerror	I2C Master PHY error indication

33.5.18 AHB Audio DMA Interrupt Status Register (HDMI_IH_AHBDMAAUD_STAT0)

Address Offset: 0x0109

Size: 8 bits

Value after Reset: 0x00

Access: Read/Clear on Write

Address: 12_0000h base + 109h offset = 12_0109h

Bit	7	6	5	4
Read	Reserved		ahbdmaaud_interror	ahbdmaaud_ intlostownership
Write			w1c	w1c
Reset	0	0	0	0

Bit	3	2	1	0
Read	ahbdmaaud_intretrysplit	ahbdmaaud_intdone	ahbdmaaud_intbufffull	ahbdmaaud_ intbuffempty
Write	w1c	w1c	w1c	w1c
Reset	0	0	0	0

HDMI_IH_AHBDMAAUD_STAT0 field descriptions

Field	Description
7–6 -	This field is reserved. Reserved
5 ahbdmaaud_interror	AHB audio DMA error interrupt
4 ahbdmaaud_ intlostownership	AHB audio DMA lost ownership interrupt
3 ahbdmaaud_ intretrysplit	AHB audio DMA RETRY/SPLIT interrupt
2 ahbdmaaud_intdone	AHB audio DMA done interrupt
1 ahbdmaaud_ intbufffull	AHB audio DMA Buffer full interrupt
0 ahbdmaaud_ intbuffempty	AHB audio DMA Buffer empty interrupt

33.5.19 Frame Composer Interrupt Mute Control Register 0 (HDMI_IH_MUTE_FC_STAT0)

- Address Offset: 0x0180
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 180h offset = 12_0180h

Bit	7	6	5	4	3	2	1	0
Read Write	AUDI	ACP	HBR	DST	OBA	AUDS	ACR	NULL
Reset	0	0	0	0	0	0	0	0

HDMI_IH_MUTE_FC_STAT0 field descriptions

Field	Description
7 AUDI	When set to 1, mutes IH_ FC_STAT0[7]
6 ACP	When set to 1, mutes IH_ FC_STAT0[6]
5 HBR	When set to 1, mutes IH_ FC_STAT0[5]
4 DST	When set to 1, mutes IH_ FC_STAT0[4]
3 OBA	When set to 1, mutes IH_ FC_STAT0[3]
2 AUDS	When set to 1, mutes IH_ FC_STAT0[2]
1 ACR	When set to 1, mutes IH_ FC_STAT0[1]
0 NULL	When set to 1, mutes IH_ FC_STAT0[0]

33.5.20 Frame Composer Interrupt Mute Control Register 1 (HDMI_IH_MUTE_FC_STAT1)

- Address Offset: 0x0181
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 181h offset = 12_0181h

Bit	7	6	5	4	3	2	1	0
Read Write	GMD	ISCR1	ISCR2	VSD	SPD	MPEG	AVI	GCP
Reset	0	0	0	0	0	0	0	0

HDMI_IH_MUTE_FC_STAT1 field descriptions

Field	Description
7 GMD	When set to 1, mutes IH_ FC_STAT1[7]
6 ISCR1	When set to 1, mutes IH_ FC_STAT1[6]
5 ISCR2	When set to 1, mutes IH_ FC_STAT1[5]
4 VSD	When set to 1, mutes IH_ FC_STAT1[4]
3 SPD	When set to 1, mutes IH_ FC_STAT1[3]
2 MPEG	When set to 1, mutes IH_ FC_STAT1[2]
1 AVI	When set to 1, mutes IH_ FC_STAT1[1]
0 GCP	When set to 1, mutes IH_ FC_STAT1[0]

33.5.21 Frame Composer Interrupt Mute Control Register 2 (HDMI_IH_MUTE_FC_STAT2)

- Address Offset: 0x0182
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 182h offset = 12_0182h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved						LowPriority_ overflow	HighPriority _overflow
Reset	0	0	0	0	0	0	0	0

HDMI_IH_MUTE_FC_STAT2 field descriptions

Field	Description
7–2 -	This field is reserved. Reserved
1 LowPriority_ overflow	When set to 1, mutes IH_ FC_STAT2[1]
0 HighPriority_ overflow	When set to 1, mutes IH_ FC_STAT2[0]

33.5.22 Audio Sampler Interrupt Mute Control Register 0 (HDMI_IH_MUTE_AS_STAT0)

- Address Offset: 0x0183
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 183h offset = 12_0183h

Bit	7	6	5	4	3	2	1	0

33.5.29 Global Interrupt Mute Control Register (HDMI_IH_MUTE)

- Address Offset: 0x01FF
- Size: 8 bits
- Value after Reset: 0x03
- Access: Read/Write

Address: 12_0000h base + 1FFh offset = 12_01FFh

Bit	7	6	5	4	3	2	1	0
Read / Write	Reserved						mute_wakeup_interrupt	mute_all_interrupt
Reset	0	0	0	0	0	0	1	1

HDMI_IH_MUTE field descriptions

Field	Description
7–2 rsvd	This field is reserved.
1 mute_wakeup_interrupt	When set to 1, mutes the wake-up interrupt line. The sticky bit interrupt continues with its state; only the wake up interrupt line is muted.
0 mute_all_interrupt	When set to 1, mutes the main interrupt line (where all interrupts are ORed). The sticky bit interrupts continue with their state; only the main interrupt line will be muted.

33.5.30 Video Input Mapping and Internal Data Enable Configuration Register (HDMI_TX_INVID0)

This registers contains the input video mapping code as defined in Table 2-1.

- Address Offset: 0x0200
- Size: 8 bits
- Value after Reset: 0x01
- Access: Read/Write

Address: 12_0000h base + 200h offset = 12_0200h

Bit	7	6	5	4	3	2	1	0
Read / Write	internal_de_generator	Reserved			video_mapping			
Reset	0	0	0	0	0	0	0	1

HDMI_TX_INVID0 field descriptions

Field	Description
7 internal_de_ generator	Internal data enable (DE) generator enable. If data enable is not available for the input video the user may set this bit to one to activate the internal data enable generator. **NOTE:** This feature only works for input video modes that have native repetition (such as, all CEA videos). No desired pixel repetition can be used with this feature because these configurations only affect the Frame Composer and not this block.
6–5 - Reserved	This field is reserved.
video_mapping	video_mapping

33.5.31 Video Input Stuffing Enable Register (HDMI_TX_INSTUFFING)

This register enables the stuffing mechanism of the Video Sampler module in order to correctly perform Color Space Conversion of the ITU.601 standard YCC video. In this case, when "de" is low, the output video components gydata[15:0], rcrdata[15:0], and bcbdata[15:0] can be configured.

- Address Offset: 0x0201
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 201h offset = 12_0201h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved					BCBDATA_ STUFFING	RCRDATA_ STUFFING	GYDATA_ STUFFING
Reset	0	0	0	0	0	0	0	0

HDMI_TX_INSTUFFING field descriptions

Field	Description
7–3 - Reserved	This field is reserved.
2 BCBDATA_ STUFFING	BCBDATA stuffing bit 0 When the dataen signal is low, the value in the bcbdata[15:0] output is the one sampled from the corresponding input data. 1 When the dataen signal is low, the value in the bcbdata[15:0] output is given by the values in register TX_BCBDTA0 and TX_BCBDATA1.
1 RCRDATA_ STUFFING	RCRDATA stuffing bit

Table continues on the next page...

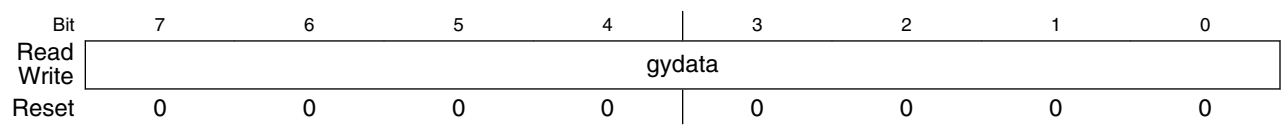
HDMI_TX_INSTUFFING field descriptions (continued)

Field	Description
	0 When the dataen signal is low, the value in the rcrdata[15:0] output is the one sampled from the corresponding input data. 1 When the dataen signal is low, the value in the rcrdata[15:0] output is given by the values in TX_RCRDTA0 and TX_RCRDATA1 registers.
0 GYDATA_ STUFFING	GYDATA stuffing bit 0 when the dataen signal is low, the value in the gydata[15:0] output is the one sampled from the corresponding input data. 1 When the dataen signal is low, the value in the gydata[15:0] output is given by the values in TX_GYDTA0 and TX_GYDATA1 registers.

33.5.32 Video Input GY Data Channel Stuffing Register 0 (HDMI_TX_GYDATA0)

- Address Offset: 0x0202
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 202h offset = 12_0202h



HDMI_TX_GYDATA0 field descriptions

Field	Description
gydata	gydata[7:0].This register defines the value of gydata[7:0] when TX_INSTUFFING[0] (gydata_stuffing) is set to 1b.

33.5.33 Video Input GY Data Channel Stuffing Register 1 (HDMI_TX_GYDATA1)

- Address Offset: 0x0203
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 203h offset = 12_0203h

Bit	7	6	5	4	3	2	1	0
Read Write	gydata							
Reset	0	0	0	0	0	0	0	0

HDMI_TX_GYDATA1 field descriptions

Field	Description
gydata	gydata[15:8].This register defines the value of gydata[15:8] when TX_INSTUFFING[0] (gydata_stuffing) is set to 1b.

33.5.34 Video Input RCR Data Channel Stuffing Register 0 (HDMI_TX_RCRDATA0)

- Address Offset: 0x0204
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 204h offset = 12_0204h

Bit	7	6	5	4	3	2	1	0
Read Write	rcrdata							
Reset	0	0	0	0	0	0	0	0

HDMI_TX_RCRDATA0 field descriptions

Field	Description
rcrdata	rcrdata[7:0]. This register defines the value of rcrydata[7:0] when TX_INSTUFFING[1] (rcrdata_stuffing) is set to 1b.

33.5.35 Video Input RCR Data Channel Stuffing Register 1 (HDMI_TX_RCRDATA1)

- Address Offset: 0x0205
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 205h offset = 12_0205h

Bit	7	6	5	4	3	2	1	0
Read Write	rcrdata							
Reset	0	0	0	0	0	0	0	0

HDMI_TX_RCRDATA1 field descriptions

Field	Description
rcrdata	rcrdata[15:8]. This register defines the value of rcrydata[15:8] when TX_INSTUFFING[1] (rcrdata_stuffing) is set to 1b.

33.5.36 Video Input RCB Data Channel Stuffing Register 0 (HDMI_TX_BCBDATA0)

- Address Offset: 0x0206
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 206h offset = 12_0206h

Bit	7	6	5	4	3	2	1	0
Read Write	bcbdata							
Reset	0	0	0	0	0	0	0	0

HDMI_TX_BCBDATA0 field descriptions

Field	Description
bcbdata	bcbdata[7:0]. This register defines the value of bcbdata[7:0] when TX_INSTUFFING[2] (bcbdata_stuffing) is set to 1b.

33.5.37 Video Input RCB Data Channel Stuffing Register 1 (HDMI_TX_BCBDATA1)

- Address Offset: 0x0207
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 207h offset = 12_0207h

Bit	7	6	5	4	3	2	1	0
Read Write	bcbdata							
Reset	0	0	0	0	0	0	0	0

HDMI_TX_BCBDATA1 field descriptions

Field	Description
bcbdata	bcbdata[15:8]. This register defines the value of bcbdata[15:8] when TX_INSTUFFING[2] (bcbdata_stuffing) is set to 1b.

33.5.38 Video Packetizer Packing Phase Status Register (HDMI_VP_STATUS)

- Address Offset: 0x0800
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 800h offset = 12_0800h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				packing_phase			
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_VP_STATUS field descriptions

Field	Description
7–4 -	This field is reserved. Reserved

Table continues on the next page...

HDMI_VP_STATUS field descriptions (continued)

Field	Description
packing_phase	Read only register that holds the "packing phase" output by the Video packetizer block. For more information about "packing" video data, refer to the HDMI1.4a specification. The register is updated at tmds clock rate.

33.5.39 Video Packetizer Pixel Repetition and Color Depth Register (HDMI_VP_PR_CD)

This register configures the Color Depth of the input video and Pixel repetition to apply to video.

- Address Offset: 0x0801
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 801h offset = 12_0801h

Bit	7	6	5	4	3	2	1	0
Read Write	color_depth[3:0]				desired_pr_factor[3:0]			
Reset	0	0	0	0	0	0	0	0

HDMI_VP_PR_CD field descriptions

Field	Description
7–4 color_depth[3:0]	Color depth configuration: other Reserved. Not used. 0000 24 bits per pixel video (8 bit per component). 8-bit packing mode. 0100 24 bits per pixel video (8 bit per component). 8-bit packing mode. 0101 30 bits per pixel video (10 bit per component). 10-bit packing mode. 0110 36 bits per pixel video (12 bit per component). 12-bit packing mode. 0111 48 bits per pixel video (16 bit per component). 16-bit packing mode.
desired_pr_ factor[3:0]	Desired pixel repetition factor configuration. The configured value sets H13T PHY PLL to multiply pixel clock by the factor in order to obtain the desired repetition clock. For the CEA modes some are already defined with pixel repetition in the input video. So for CEA modes this shall be always 0. Shall only be used if the user wants to do pixel repetition using H13TCTRL core. other Reserved. Not used. 0000 No pixel repetition (pixel sent only once) 0001 Pixel sent 2 times (pixel repeated once) 0010 Pixel sent 3 times 0011 Pixel sent 4 times 0100 Pixel sent 5 times 0101 Pixel sent 6 times

Table continues on the next page...

HDMI_VP_PR_CD field descriptions (continued)

Field	Description
	0110 Pixel sent 7 times 0111 Pixel sent 8 times 1000 Pixel sent 9 times 1001 Pixel sent 10 times

33.5.40 Video Packetizer Stuffing and Default Packing Phase Register (HDMI_VP_STUFF)

This register controls the Pixel repetition, pixel packing and YCC422 stuffing.

- Address Offset: 0x0802
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 802h offset = 12_0802h

Bit	7	6	5	4
Read Write	Reserved		idefault_phase	ifix_pp_to_last
Reset	0	0	0	0

Bit	3	2	1	0
Read Write	icx_goto_p0_st	ycc422_stuffing	pp_stuffing	pr_stuffing
Reset	0	0	0	0

HDMI_VP_STUFF field descriptions

Field	Description
7–6 -	This field is reserved. Reserved
5 idefault_phase	Controls the default phase packing machine used according to: "If the transmitted video format has timing such that the phase of the first pixel of every Video Data Period corresponds to pixel packing phase 0 (for example, 10P0, 12P0, 16P0), the Source may set the Default_Phase bit in the GCP. The Sink may use this bit to optimize it's filtering or handling of the PP field." (HDMI specification version 1.4a) This means that for10 bit mode the Htotal must be dividable by 4 and for 12 bit mode the Htotal must be dividable by 2.
4 ifix_pp_to_last	Reserved. Controls packing machine strategy.
3 icx_goto_p0_st	Reserved. Controls packing machine strategy.
2 ycc422_stuffing	YCC 422 remap stuffing control. For horizontal blanking: 0 YCC 422 remap block in direct mode (input blanking data goes directly to output). 1 YCC 422 remap block in stuffing mode. When "de" goes to low the outputs are fixed to 0x00.

Table continues on the next page...

HDMI_VP_STUFF field descriptions (continued)

Field	Description
1 pp_stuffing	Pixel packing stuffing control 0 Pixel packing block in direct mode (input blanking data goes directly to output). 1 Pixel packing block in stuffing mode. When "de_rep" goes to low the outputs are fixed to 0x00.
0 pr_stuffing	Pixel repeater stuffing control 0 Pixel repeater block in direct mode (input blanking data goes directly to output). 1 Pixel repeater block in stuffing mode. When "de" goes to low the outputs are fixed to 0x00.

33.5.41 Video Packetizer YCC422 Remapping Register (HDMI_VP_REMAP)

This register controls YCC422 remap of the Video Packetizer. For more information about YCC422 remap refer to HDMI 1.4a specification.

- Address Offset: 0x0803
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 803h offset = 12_0803h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved						ycc422_size[1:0]	
Reset	0	0	0	0	0	0	0	0

HDMI_VP_REMAP field descriptions

Field	Description
7–2 -	This field is reserved. Reserved
ycc422_size[1:0]	YCC 422 remap input video size: 00 YCC 422 16-bit input video (8 bits per component). 01 YCC 422 20-bit input video (10 bits per component). 10 YCC 422 24-bit input video (12 bits per component). 11 Reserved. Not used.

33.5.42 Video Packetizer Output, Bypass, and Enable Configuration Register (HDMI_VP_CONF)

This register controls the Video Packetizer output selection, bypass select, YCC422 enable, Pixel repeater, and pixel packing enabling.

- Address Offset: 0x0804
- Size: 8 bits
- Value after Reset: 0x46
- Access: Read/Write

Address: 12_0000h base + 804h offset = 12_0804h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved	bypass_en	pp_en	pr_en	ycc422_en	BYPASS_ SELECT	output_selector[1:0]	
Reset	0	1	0	0	0	1	1	0

HDMI_VP_CONF field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 bypass_en	Bypass enable. Disabling forces bypass module to output always zeros.
5 pp_en	Pixel packing enable. Disabling forces bypass module to output always zeros.
4 pr_en	Pixel repeater enable. Disabling forces bypass module to output always zeros.
3 ycc422_en	YCC 422 select enable. Disabling forces bypass module to output always zeros.
2 BYPASS_ SELECT	Bypass select bit 0 Data from pixel repeater block. 1 Data from input of video packetizer block.
output_ selector[1:0]	Video packetizer output selection. 00 Data from pixel packing block. 01 Data from YCC 422 remap block. 10 Data from 8-bit bypass block. 11 Data from 8-bit bypass block.

33.5.43 VP_STAT (HDMI_VP_STAT)

This register contains the following active high FIFO status indications:

- Address Offset: 0x0805
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 805h offset = 12_0805h

Bit	7	6	5	4
Read	ostfullrepet	ostemptyrepet	ostfullpp	ostemptypp
Write				
Reset	0	0	0	0

Bit	3	2	1	0
Read	ostfullremap	ostemptyremap	ostfullbyp	ostemptybyp
Write				
Reset	0	0	0	0

HDMI_VP_STAT field descriptions

Field	Description
7 ostfullrepet	Video packetizer pixel repeater FIFO full status.
6 ostemptyrepet	Video packetizer pixel repeater FIFO empty status.
5 ostfullpp	Video packetizer pixel packing FIFO full status.
4 ostemptypp	Video packetizer pixel packing FIFO empty status.
3 ostfullremap	Video packetizer pixel YCC 422 re-mapper FIFO full status.
2 ostemptyremap	Video packetizer pixel YCC 422 re-mapper FIFO empty status.
1 ostfullbyp	Video packetizer 8-bit bypass FIFO full status.
0 ostemptybyp	Video packetizer 8-bit bypass FIFO empty status.

33.5.44 VP_INT (HDMI_VP_INT)

This register contains the interrupt indication of the VP_STAT status interrupts. Interrupt generation is accomplished in the following way:

interrupt = (mask == 1'b0) && (polarity == status);

All this interrupts are forwarded to the Interrupt Handler sticky bit registers and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

- Address Offset: 0x0806
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 806h offset = 12_0806h

Bit	7	6	5	4
Read	ointfullrepet	ointemptyrepet	ointfullpp	ointemptypp
Write				
Reset	0	0	0	0

Bit	3	2	1	0
Read	ointfullremap	ointemptyremap	ointfullbyp	ointemptybyp
Write				
Reset	0	0	0	0

HDMI_VP_INT field descriptions

Field	Description
7 ointfullrepet	Video packetizer pixel repeater FIFO full status
6 ointemptyrepet	Video packetizer pixel repeater FIFO empty status
5 ointfullpp	Video packetizer pixel packing FIFO full status
4 ointemptypp	Video packetizer pixel packing FIFO empty status
3 ointfullremap	Video packetizer pixel YCC 422 re-mapper FIFO full status.
2 ointemptyremap	Video packetizer pixel YCC 422 re-mapper FIFO empty status.
1 ointfullbyp	Video packetizer 8-bit bypass FIFO full status.
0 ointemptybyp	Video packetizer 8-bit bypass FIFO empty status.

33.5.45 Video Packetizer Interrupt Mask Register (HDMI_VP_MASK)

Mask register for generation of VP_INT interrupts.

- Address Offset: 0x0807
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 807h offset = 12_0807h

Bit	7	6	5	4	3	2	1	0
Read Write	VPMASK7	VPMASK6	VPMASK5	VPMASK4	VPMASK3	VPMASK2	VPMASK1	VPMASK0
Reset	0	0	0	0	0	0	0	0

HDMI_VP_MASK field descriptions

Field	Description
7 VPMASK7	Mask bit for VP_INT[7] interrupt bit.
6 VPMASK6	Mask bit for VP_INT[6] interrupt bit.
5 VPMASK5	Mask bit for VP_INT[5] interrupt bit.
4 VPMASK4	Mask bit for VP_INT[4] interrupt bit.
3 VPMASK3	Mask bit for VP_INT[3] interrupt bit.
2 VPMASK2	Mask bit for VP_INT[2] interrupt bit.
1 VPMASK1	Mask bit for VP_INT[1] interrupt bit.
0 VPMASK0	Mask bit for VP_INT[0] interrupt bit.

33.5.46 VP_POL (HDMI_VP_POL)

Polarity register for generation of VP_INT interrupts.

- Address Offset: 0x0808
- Size: 8 bits
- Value after Reset: 0xFF
- Access: Read/Write

Address: 12_0000h base + 808h offset = 12_0808h

Bit	7	6	5	4	3	2	1	0
Read Write	VPPOL7	VPPOL6	VPPOL5	VPPOL4	VPPOL3	VPPOL2	VPPOL1	VPPOL0
Reset	1	1	1	1	1	1	1	1

HDMI_VP_POL field descriptions

Field	Description
7 VPPOL7	Polarity bit for VP_INT[7] interrupt bit.
6 VPPOL6	Polarity bit for VP_INT[6] interrupt bit.
5 VPPOL5	Polarity bit for VP_INT[5] interrupt bit.
4 VPPOL4	Polarity bit for VP_INT[4] interrupt bit.
3 VPPOL3	Polarity bit for VP_INT[3] interrupt bit.
2 VPPOL2	Polarity bit for VP_INT[2] interrupt bit.
1 VPPOL1	Polarity bit for VP_INT[1] interrupt bit.
0 VPPOL0	Polarity bit for VP_INT[0] interrupt bit.

33.5.47 Frame Composer Input Video Configuration and HDCP Keepout Register (HDMI_FC_INVIDCONF)

This register configures the Interlaced/progressive, Vblank variation and polarity of all video synchronism of the input video signal.

- Address Offset: 0x1000
- Size: 8 bits
- Value after Reset: 0x70
- Access: Read/Write

Address: 12_0000h base + 1000h offset = 12_1000h

Bit	7	6	5	4
Read Write	Reserved	vsync_in_polarity	hsync_in_polarity	de_in_polarity
Reset	0	1	1	1

Bit	3	2	1	0
Read Write	DVI_mode	Reserved	r_v_blank_in_osc	in_I_P
Reset	0	0	0	0

HDMI_FC_INVIDCONF field descriptions

Field	Description
7 -	This field is reserved. Reserved

Table continues on the next page...

HDMI_FC_INVIDCONF field descriptions (continued)

Field	Description
6 vsync_in_polarity	Vsync input polarity 1 Active high 0 Active low
5 hsync_in_polarity	Hsync input polarity 1 Active high 0 Active low
4 de_in_polarity	Data enable input polarity 1 Active high 0 Active low
3 DVI_mode	Active low 0 DVI mode selected 1 HDMI mode selected
2 -	This field is reserved. Reserved
1 r_v_blank_in_osc	Used for CEA861-D modes with fractional Vblank (for example, modes 5, 6, 7, 10, 11, 20, 21, and 22. For more modes, refer to CEA861-D specification. 1 Active high
0 in_I_P	Input video mode: 1 Interlaced 0 Progressive

33.5.48 Frame Composer Input Video HActive Pixels Register 0 (HDMI_FC_INHACTIV0)

- Address Offset: 0x1001
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1001h offset = 12_1001h

Bit	7	6	5	4	3	2	1	0
Read Write	H_in_activ[7:0]							
Reset	0	0	0	0	0	0	0	0

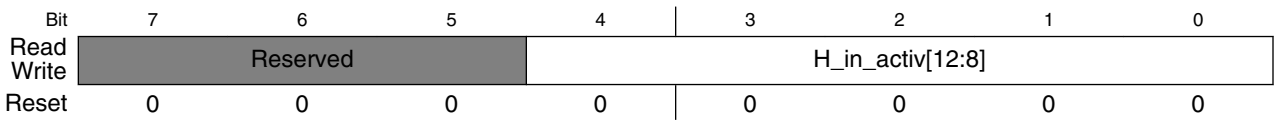
HDMI_FC_INHACTIV0 field descriptions

Field	Description
H_in_activ[7:0]	Input video Horizontal active pixel region width. Number of Horizontal active pixels [0...8191].

33.5.49 Frame Composer Input Video HActive Pixels Register 1 (HDMI_FC_INHACTIV1)

- Address Offset: 0x1002
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1002h offset = 12_1002h



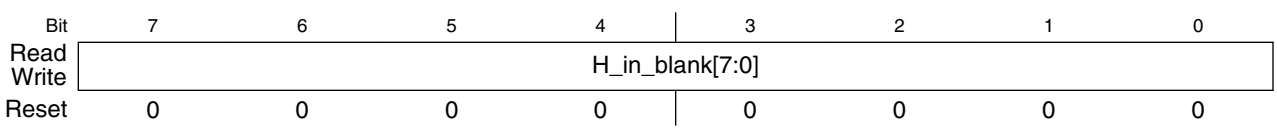
HDMI_FC_INHACTIV1 field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
H_in_activ[12:8]	Input video Horizontal active pixel region width. Dependencies: Value after Reset: 0000b • the higher bit of Horizontal active pixels; Number of Horizontal active pixels [0...8191].

33.5.50 Frame Composer Input Video HBlank Pixels Register 0 (HDMI_FC_INHBLANK0)

- Address Offset: 0x1003
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1003h offset = 12_1003h



HDMI_FC_INHBLANK0 field descriptions

Field	Description
H_in_blank[7:0]	Input video Horizontal blanking pixel region width. Number of Horizontal blanking pixels [0...4095].

33.5.51 Frame Composer Input Video HBlank Pixels Register 1 (HDMI_FC_INHBLANK1)

- Address Offset: 0x1004
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1004h offset = 12_1004h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				H_in_blank[12:8]			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_INHBLANK1 field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
H_in_blank[12:8]	Input video Horizontal blanking pixel region width. Dependencies: Value after Reset: 0000b • the higher bits of Horizontal blanking pixels; Number of Horizontal blanking pixels [0...8191].

33.5.52 Frame Composer Input Video VActive Pixels Register 0 (HDMI_FC_INVACTIV0)

- Address Offset: 0x1005
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1005h offset = 12_1005h

Bit	7	6	5	4	3	2	1	0
Read Write	V_in_activ[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_INVACTIV0 field descriptions

Field	Description
V_in_activ[7:0]	Input video Vertical active pixel region width. Number of Vertical active lines [0...4095].

33.5.53 Frame Composer Input Video VActive Pixels Register 1 (HDMI_FC_INVACTIV1)

- Address Offset: 0x1006
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1006h offset = 12_1006h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved			V_in_activ[12:8]				
Reset	0	0	0	0	0	0	0	0

HDMI_FC_INVACTIV1 field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
V_in_activ[12:8]	Input video Vertical active pixel region width. Dependencies: Value after Reset: 0000b

Table continues on the next page...

HDMI_FC_INVACTIV1 field descriptions (continued)

Field	Description
	• the higher 5 bits of Vertical active line; Number of Vertical active lines [0...8191].

33.5.54 Frame Composer Input Video VBlank Pixels Register (HDMI_FC_INVBLANK)

- Address Offset: 0x1007
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1007h offset = 12_1007h

Bit	7	6	5	4	3	2	1	0
Read Write	V_in_blank[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_INVBLANK field descriptions

Field	Description
V_in_blank[7:0]	Input video Vertical blanking pixel region width. Number of Vertical blanking lines [0...255]. Value after Reset: 0x00

33.5.55 Frame Composer Input Video HSync Front Porch Register 0 (HDMI_FC_HSYNCINDELAY0)

- Address Offset: 0x1008
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1008h offset = 12_1008h

Bit	7	6	5	4	3	2	1	0
Read Write	H_in_delay[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_HSYNCINDELAY0 field descriptions

Field	Description
H_in_delay[7:0]	Input video Hsync active edge delay. Integer number of pixel clock cycles from "de" non active edge of the last "de" valid period [0...4095].

33.5.56 Frame Composer Input Video HSync Front Porch Register 1 (HDMI_FC_HSYNCINDELAY1)

- Address Offset: 0x1009
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1009h offset = 12_1009h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				H_in_delay[12:8]			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_HSYNCINDELAY1 field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
H_in_delay[12:8]	Input video Hsync active edge delay. Dependencies: Value after Reset: 0000b • the higher 5 bits of delay; Integer number of pixel clock cycles from "de" non active edge of the last "de" valid period [0...8191].

33.5.57 Frame Composer Input Video HSync Width Register 0 (HDMI_FC_HSYNCINWIDTH0)

- Address Offset: 0x100A
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 100Ah offset = 12_100Ah

Bit	7	6	5	4	3	2	1	0
Read Write	H_in_width[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_HSYNCINWIDTH0 field descriptions

Field	Description
H_in_width[7:0]	Input video Hsync active pulse width. Integer number of pixel clock cycles [0...511].

33.5.58 Frame Composer Input Video HSync Width Register 1 (HDMI_FC_HSYNCINWIDTH1)

- Address Offset: 0x100B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 100Bh offset = 12_100Bh

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved						H_in_width[9:8]	
Reset	0	0	0	0	0	0	0	0

HDMI_FC_HSYNCINWIDTH1 field descriptions

Field	Description
7–2 -	This field is reserved. Reserved
H_in_width[9:8]	Input video Hsync active pulse width. Dependencies: Value after Reset after Reset: 0b

Table continues on the next page...

HDMI_FC_HSYNCINWIDTH1 field descriptions (continued)

Field	Description
	• Integer number of pixel clock cycles [0...1024].

33.5.59 Frame Composer Input Video VSync Front Porch Register (HDMI_FC_VSYNCINDELAY)

- Address Offset: 0x100C
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 100Ch offset = 12_100Ch

Bit	7	6	5	4	3	2	1	0
Read Write	V_in_delay[7..0]							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_VSYNCINDELAY field descriptions

Field	Description
V_in_delay[7..0]	Input video Vsync active edge delay. Integer number of Hsync pulses from "de" non active edge of the last "de" valid period. [0...255].

33.5.60 Frame Composer Input Video VSync Width Register (HDMI_FC_VSYNCINWIDTH)

- Address Offset: 0x100D
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 100Dh offset = 12_100Dh

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved		V_in_width[5..0]					
Reset	0	0	0	0	0	0	0	0

HDMI_FC_VSYNCINWIDTH field descriptions

Field	Description
7–6 -	This field is reserved. Reserved
V_in_width[5..0]	Value after Reset: 000000b Input video Vsync active pulse width: Integer number of pixel clock cycles [0...63].

33.5.61 Frame Composer Input Video Refresh Rate Register 0 (HDMI_FC_INFREQ0)

- Address Offset: 0x100E
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 100Eh offset = 12_100Eh

Bit	7	6	5	4	3	2	1	0
Read Write	infreq[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_INFREQ0 field descriptions

Field	Description
infreq[7:0]	Video refresh rate in Hz*1E3 format. This registers are provided for debug and informative purposes. No data is written to this registers by the H13TCTRL and the data here written by software is not used in any way by the H13TCTRL.

33.5.62 Frame Composer Input Video Refresh Rate Register 1 (HDMI_FC_INFREQ1)

- Address Offset: 0x100F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 100Fh offset = 12_100Fh

Bit	7	6	5	4	3	2	1	0
Read Write	infreq[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_INFREQ1 field descriptions

Field	Description
infreq[7:0]	Video refresh rate in Hz*1E3 format. This registers are provided for debug and informative purposes. No data is written to this registers by the H13TCTRL and the data here written by software is not used in any way by the H13TCTRL.

33.5.63 Frame Composer Input Video Refresh Rate Register 2 (HDMI_FC_INFREQ2)

- Address Offset: 0x1010
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1010h offset = 12_1010h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				infreq[19:16]			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_INFREQ2 field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
infreq[19:16]	Video refresh rate in Hz*1E3 format. This registers are provided for debug and informative purposes. No data is written to this registers by the H13TCTRL and the data here written by software is not used in any way by the H13TCTRL. Value after Reset: 0000b

33.5.64 Frame Composer Control Period Duration Register (HDMI_FC_CTRLDUR)

- Address Offset: 0x1011
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1011h offset = 12_1011h

Bit	7	6	5	4	3	2	1	0
Read Write	ctrlperiodduration							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_CTRLDUR field descriptions

Field	Description
ctrlperiodduration	Configuration of the control period minimum duration (min. of 12 pixel clock cycles, refer to HDMI 1.4a specification). Integer number of pixel clocks cycles [0..255].

33.5.65 Frame Composer Extended Control Period Duration Register (HDMI_FC_EXCTRLDUR)

- Address Offset: 0x1012
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1012h offset = 12_1012h

Bit	7	6	5	4	3	2	1	0
Read Write	exctrlperiodduration							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_EXCTRLDUR field descriptions

Field	Description
exctrlperiodduration	Configuration of the extended control period minimum duration (min. of 32 pixel clock cycles, see HDMI 1.4a specification). Integer number of pixel clocks cycles [0..255].

33.5.66 Frame Composer Extended Control Period Maximum Spacing Register (HDMI_FC_EXCTRLSPAC)

- Address Offset: 0x1013
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1013h offset = 12_1013h

Bit	7	6	5	4	3	2	1	0
Read / Write	exctrlperiodspacing							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_EXCTRLSPAC field descriptions

Field	Description
exctrlperiodspacing	Configuration of the maximum spacing between consecutive extended control periods (max of 50msec, see HDMI 1.4a specification): generated spacing = (1/freq tmds clock)*256*256*extctrlperiodspacing

33.5.67 Frame Composer Channel 0 Non-Preamble Data Register (HDMI_FC_CH0PREAM)

- Address Offset: 0x1014
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1014h offset = 12_1014h

Bit	7	6	5	4	3	2	1	0
Read / Write	ch0_preamble_filter							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_CH0PREAM field descriptions

Field	Description
ch0_preamble_filter	When in control mode, configures 8-bits that are going to fill the channel 0 data lines not used to transmit the preamble (for more clarifications refer to HDMI 1.4a specification).

33.5.68 Frame Composer Channel 1 Non-Preamble Data Register (HDMI_FC_CH1PREAM)

- Address Offset: 0x1015
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1015h offset = 12_1015h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				ch1_preamble_filter			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_CH1PREAM field descriptions

Field	Description
7–6 -	This field is reserved. Reserved
ch1_preamble_filter	When in control mode, configures 6-bits that are going to fill the channel 1 data lines not used to transmit the preamble (for more clarifications refer to HDMI 1.4a specification).

33.5.69 Frame Composer Channel 2 Non-Preamble Data Register (HDMI_FC_CH2PREAM)

- Address Offset: 0x1016
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1016h offset = 12_1016h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				ch2_preamble_filter			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_CH2PREAM field descriptions

Field	Description
7–6 -	This field is reserved. Reserved

Table continues on the next page...

HDMI_FC_CH2PREAM field descriptions (continued)

Field	Description
ch2_preamble_filter	When in control mode, configures 6-bits that are going to fill the channel 2 data lines not used to transmit the preamble (for more clarifications, see HDMI 1.4a specification).

33.5.70 Frame Composer AVI Configuration Register 3 (HDMI_FC_AVICONF3)

- Address Offset: 0x1017
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

configuration of Quantization range and IT content type.

Address: 12_0000h base + 1017h offset = 12_1017h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				YQ1_YQ0_YCC		CN1_CN0	
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVICONF3 field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
3–2 YQ1_YQ0_YCC	Quantization range according to CEA specification.
CN1_CN0	IT content type according to CEA specification

33.5.71 Frame Composer GCP Packet Configuration Register (HDMI_FC_GCP)

Configures the General Control Packet A/V mute indicators and the default phase.

- Address Offset: 0x1018
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1018h offset = 12_1018h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved					default_ phase	set_avmute	clear_ avmute
Reset	0	0	0	0	0	0	0	0

HDMI_FC_GCP field descriptions

Field	Description
7–3 -	This field is reserved. Reserved
2 default_phase	Value of "default_phase" in the GCP packet. This data should be equal to the default phase used at Video packetizer packing machine. Value after Reset: 0b
1 set_avmute	Value of "set_avmute" in the GCP packet. Value after Reset: 0b
0 clear_avmute	Value of "clear_avmute" in the GCP packet. Value after Reset: 0b

33.5.72 Frame Composer AVI Packet Configuration Register 0 (HDMI_FC_AVICONF0)

Configures the following contents of the AVI infoFrame:

- RGB/YCC indication
- Bar information
- Scan information
- Active format present
- Progressive/Interlaced indicator
- Active aspect ratio
- Picture aspect ratio
- Colorimetry
- IT content
- Extended colorimetry
- Quantization range
- Non-uniform picture scaling

For more information, refer to HDMI 1.4a and CEA - 861D specifications.

- Address Offset: 0x1019
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1019h offset = 12_1019h

Bit	7	6	5	4	3	2	1	0
Read Write	FC_AVICONF0_MISC	FC_AVICONF0_ACTIVE_FORMAT	FC_AVICONF0_SCAN		FC_AVICONF0_BAR		FC_AVICONF0_RGB_YCC	
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVICONF0 field descriptions

Field	Description
7 FC_AVICONF0_MISC	Frame composer AVI packet configuration bit
6 FC_AVICONF0_ACTIVE_FORMAT	Active format present
5–4 FC_AVICONF0_SCAN	Scan information
3–2 FC_AVICONF0_BAR	Bar information
FC_AVICONF0_RGB_YCC	RGB/YCC indication Value after Reset: 0b

33.5.73 Frame Composer AVI Packet Configuration Register 1 (HDMI_FC_AVICONF1)

- Address Offset: 0x101A
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 101Ah offset = 12_101Ah

Bit	7	6	5	4	3	2	1	0
Read Write	FC_AVICONF0_COLOR		FC_AVICONF1_PICTURE_AR		FC_AVICONF1_ACTIVE_AR			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVICONF1 field descriptions

Field	Description
7–6 FC_AVICONF0_COLOR	Colorimetry
5–4 FC_AVICONF1_PICTURE_AR	Picture aspect ratio
FC_AVICONF1_ACTIVE_AR	Active aspect ratio Value after Reset: 0b

33.5.74 FC_AVICONFFrame Composer AVI Packet Configuration Register 2 (HDMI_FC_AVICONF2)

- Address Offset: 0x101B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 101Bh offset = 12_101Bh

Bit	7	6	5	4	3	2	1	0
Read Write	FC_AVICONF2_IT	FC_AVICONF2_EXT_COLOR			-		FC_AVICONF2_SCALE	
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVICONF2 field descriptions

Field	Description
7 FC_AVICONF2_IT	IT content
6–4 FC_AVICONF2_EXT_COLOR	Extended colorimetry
3–2 -	Quantization range
FC_AVICONF2_SCALE	Non-uniform picture scaling Value after Reset: 0b

33.5.75 Frame Composer AVI Packet VIC Register (HDMI_FC_AVIVID)

Configures the AVI infoFrame Video Identification code. For more information, refer to the CEA-861-E specification.

- Address Offset: 0x101C
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 101Ch offset = 12_101Ch

Bit	7	6	5	4	3	2	1	0
Read Write	FC_AVIVID							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVIVID field descriptions

Field	Description
FC_AVIVID	the AVI infoFrame Video Identification code.

33.5.76 Frame Composer AVI Packet End of Top Bar Register 0 (HDMI_FC_AVIETB0)

These registers define the AVI infoFrame End of Top Bar value. For more information, refer to CEA-861-E specification.

- Address Offset: 0x101D
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 101Dh offset = 12_101Dh

Bit	7	6	5	4	3	2	1	0
Read Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVIETB0 field descriptions

Field	Description
-	Line number of end of top bar (lower 8 bits)

33.5.77 Frame Composer AVI Packet End of Top Bar Register 1 (HDMI_FC_AVIETB1)

- Address Offset: 0x101E
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 101Eh offset = 12_101Eh

Bit	7	6	5	4	3	2	1	0
Read Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVIETB1 field descriptions

Field	Description
-	Line number of end of top bar (upper 8 bits)

33.5.78 Frame Composer AVI Packet Start of Bottom Bar Register 0 (HDMI_FC_AVISBB0)

These registers define the AVI infoFrame Start of Bottom Bar value. For more information, refer to CEA-861D specification.

- Address Offset: 0x101F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 101Fh offset = 12_101Fh

Bit	7	6	5	4	3	2	1	0
Read Write	FC_AVISBB0							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVISBB0 field descriptions

Field	Description
FC_AVISBB0	Line number of Start of Bottom Bar (lower 8 bits)

33.5.79 Frame Composer AVI Packet Start of Bottom Bar Register 1 (HDMI_FC_AVISBB1)

- Address Offset: 0x1020
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1020h offset = 12_1020h

Bit	7	6	5	4	3	2	1	0
Read Write	FC_AVISBB1							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVISBB1 field descriptions

Field	Description
FC_AVISBB1	Line number of Start of Bottom Bar (upper 8 bits)

33.5.80 Frame Composer AVI Packet End of Left Bar Register 0 (HDMI_FC_AVIELB0)

These registers define the AVI infoFrame End of Left Bar value. For more information, refer to CEA-861D specification.

- Address Offset: 0x1021
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1021h offset = 12_1021h

Bit	7	6	5	4	3	2	1	0
Read Write	FC_AVIELB0							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVIELB0 field descriptions

Field	Description
FC_AVIELB0	Pixel number of end of left Bar (lower 8 bits)

33.5.81 Frame Composer AVI Packet End of Left Bar Register 1 (HDMI_FC_AVIELB1)

- Address Offset: 0x1022
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1022h offset = 12_1022h

Bit	7	6	5	4	3	2	1	0
Read Write	FC_AVIELB1							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVIELB1 field descriptions

Field	Description
FC_AVIELB1	Pixel number of end of left Bar (lower 8 bits)

33.5.82 Frame Composer AVI Packet Start of Right Bar Register 0 (HDMI_FC_AVISRB0)

These registers define the AVI infoFrame Start of Right Bar value. For more information, refer to CEA-861D specification.

- Address Offset: 0x1023
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1023h offset = 12_1023h

Bit	7	6	5	4	3	2	1	0
Read Write	FC_AVISRB0							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVISRB0 field descriptions

Field	Description
FC_AVISRB0	Pixel number of start of right Bar (lower 8 bits)

33.5.83 Frame Composer AVI Packet Start of Right Bar Register 1 (HDMI_FC_AVISRB1)

- Address Offset: 0x1024
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1024h offset = 12_1024h

Bit	7	6	5	4	3	2	1	0
Read Write	FC_AVISRB1							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AVISRB1 field descriptions

Field	Description
FC_AVISRB1	Pixel number of start of right Bar (upper 8 bits)

33.5.84 Frame Composer AUD Packet Configuration Register 0 (HDMI_FC_AUDICONF0)

These registers configure the following contents of the AUDIO infoFrame:

- Coding type
- Channel count
- Sampling frequency
- Sampling size
- Channel allocation
- Audio level shift value
- Down mix enable

For more information, refer to CEA-861D specification.

- Address Offset: 0x1025 to 0x1028
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For the FC_AUDICONF0 register, bits [6:5] correspond to LFEPBL1, LFEPBL0 LFE playback level as compared to the other channels (from HDMI 1.4a specification).

Address: 12_0000h base + 1025h offset = 12_1025h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved	CC[2:0]			CT[3:0]			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AUDICONF0 field descriptions

Field	Description
7 -	This field is reserved. Reserved
6–4 CC[2:0]	Channel count
CT[3:0]	Coding Type

33.5.85 Frame Composer AUD Packet Configuration Register 1 (HDMI_FC_AUDICONF1)

Address: 12_0000h base + 1026h offset = 12_1026h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved		SS[1:0]		Reserved	SF[2:0]		
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AUDICONF1 field descriptions

Field	Description
7–6 -	This field is reserved. Reserved
5–4 SS[1:0]	Sampling size
3 -	This field is reserved. Reserved
SF[2:0]	Sampling frequency

33.5.86 Frame Composer AUD Packet Configuration Register 2 (HDMI_FC_AUDICONF2)

Address: 12_0000h base + 1027h offset = 12_1027h

Bit	7	6	5	4	3	2	1	0
Read Write	CA[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AUDICONF2 field descriptions

Field	Description
CA[7:0]	Channel allocation

33.5.87 Frame Composer AUD Packet Configuration Register 3 (HDMI_FC_AUDICONF3)

Address: 12_0000h base + 1028h offset = 12_1028h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved	LFEPBL[1:0]		DM_INH	LSV[3:0]			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AUDICONF3 field descriptions

Field	Description
7 -	This field is reserved. Reserved
6–5 LFEPBL[1:0]	LFE playback information
4 DM_INH	Down mix enable
LSV[3:0]	Level shift value (for down mixing)

33.5.88 Frame Composer VSI Packet Data IEEE Register 0 (HDMI_FC_VSDIEEEID0)

These registers configure the Vendor Specific infoFrame IEEE registration identifier. For more information, refer to CEA-861D specification.

- Address Offset: 0x1029
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1029h offset = 12_1029h

Bit	7	6	5	4	3	2	1	0
Read Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_VSDIEEEID0 field descriptions

Field	Description
-	the Vendor Specific infoFrame IEEE registration identifier byte 0

33.5.89 Frame Composer VSI Packet Data Size Register (HDMI_FC_VSDSIZE)

- Address Offset: 0x102A
- Size: 8 bits
- Value after Reset: 0x1B
- Access: Read/Write

configuration of Packet size.

Address: 12_0000h base + 102Ah offset = 12_102Ah

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				VSDSIZE			
Reset	0	0	0	1	1	0	1	1

HDMI_FC_VSDSIZE field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
VSDSIZE	Packet size as described in HDMI Vendor Specific InfoFrame (from HDMI specification).

33.5.90 Frame Composer VSI Packet Data IEEE Register 1 (HDMI_FC_VSDIEEEID1)

- Address Offset: 0x102a
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1030h offset = 12_1030h

Bit	7	6	5	4	3	2	1	0
Read Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_VSDIEEEID1 field descriptions

Field	Description
-	the Vendor Specific infoFrame IEEE registration identifier byte 1

33.5.91 Frame Composer VSI Packet Data IEEE Register 2 (HDMI_FC_VSDIEEEID2)

- Address Offset: 0x102b
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1031h offset = 12_1031h

Bit	7	6	5	4	3	2	1	0
Read Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_VSDIEEEID2 field descriptions

Field	Description
-	the Vendor Specific infoFrame IEEE registration identifier byte 2

33.5.92 Frame Composer VSI Packet Data IEEE Register 0 (HDMI_FC_VSDPAYLOAD0)

These registers configure the Vendor Specific infoFrame 24 bytes specific payload. For more information, refer to CEA-861D specification.

- Address Offset: 0x1032
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1032h offset = 12_1032h

Bit	7	6	5	4	3	2	1	0
Read Write	-

Field	Description
vendor_name	Vendor name

33.5.117 Frame Composer SPD Packet Data Product Name Register 0 (HDMI_FC_SPDPRODUCTNAME0)

These registers configure the Source Product Descriptor infoFrame 16 bytes Product name. For more information, refer to CEA-861D specification.

- Address Offset: 0x1052 to 0x1061
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1052h offset = 12_1052h

Bit	7	6	5	4	3	2	1	0
Read Write	product_name							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_SPDPRODUCTNAME0 field descriptions

Field	Description
product_name	Product name

33.5.118 Frame Composer SPD Packet Data Source Product Descriptor Register (HDMI_FC_SPDDEVICEINF)

This register configures Source Product Descriptor infoFrame description device field. For more information, refer to CEA-861D specification.

- Address Offset: 0x1062
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1062h offset = 12_1062h

Bit	7	6	5	4	3	2	1	0
Read Write	product_descriptor							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_SPDDEVICEINF field descriptions

Field	Description
product_ descriptor	Product descriptor

33.5.119 Frame Composer Audio Sample Flat and Layout Configuration Register (HDMI_FC_AUDSCONF)

Configures the Audio sample packet sample flat and layout configuration. For more information, refer to HDMI 1.4a specification.

- Address Offset: 0x1063
- Size: 8 bits
- Value after Reset: 0x00
- AEccess: Read/Write

Address: 12_0000h base + 1063h offset = 12_1063h

Bit	7	6	5	4	3	2	1	0
Read / Write	aud_packet_sampfit[3:0]				Reserved			aud_packet_layout
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AUDSCONF field descriptions

Field	Description
7–4 aud_packet_sampfit[3:0]	Set the audio packet sample flat value to be sent on the packet.
3–1 -	This field is reserved. Reserved
0 aud_packet_layout	Set the audio packet layout to be sent in the packet: 1 layout 1 0 layout 0

33.5.120 Frame Composer Audio Packet Sample Present Status Register (HDMI_FC_AUDSSTAT)

Shows the data sample present indication of the last Audio sample packet sent by the HDMI TX Controller. For more information, refer to HDMI 1.4a specification.

- Address Offset: 0x1064
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 1064h offset = 12_1064h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				packet_sampprs[3:0]			
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_FC_AUDSSTAT field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
packet_ sampprs[3:0]	Shows the data sample present indication of the last Audio sample packet sent by the HDMI TX Controller. This register information is at tmds clock rate.

33.5.121 Frame Composer Number of High Priority Packets Attended Configuration Register (HDMI_FC_CTRLQHIGH)

- Address Offset: 0x1073
- Size: 8 bits
- Value after Reset: 0x0F
- Access: Read/Write

Address: 12_0000h base + 1073h offset = 12_1073h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				onhighattended[4:0]			
Reset	0	0	0	0	1	1	1	1

HDMI_FC_CTRLQHIGH field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
onhighattended[4:0]	Configures the number of high priority packets or audio sample packets consecutively attended before checking low priority queue status. Integer number [0..31]

33.5.122 Frame Composer Number of Low Priority Packets Attended Configuration Register (HDMI_FC_CTRLQLOW)

- Address Offset: 0x1074
- Size: 8 bits
- Value after Reset: 0x03
- Access: Read/Write

Address: 12_0000h base + 1074h offset = 12_1074h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				onlowattended[4:0]			
Reset	0	0	0	0	0	0	1	1

HDMI_FC_CTRLQLOW field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
onlowattended[4:0]	Configures the number of low priority packets or null packets consecutively attended before checking high priority queue status or audio sample availability. Integer number [0..31]

33.5.123 Frame Composer ACP Packet Type Configuration Register 0 (HDMI_FC_ACP0)

Configures the following contents of the ACP packet. For more information, refer to the HDMI 1.4 specification.

- Address Offset: 0x1075
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1075h offset = 12_1075h

Bit	7	6	5	4	3	2	1	0
Read Write	acptype[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_ACP0 field descriptions

Field	Description
acptype[7:0]	Configures the ACP packet type.

33.5.124 Frame Composer ACP Packet Type Configuration Register 1 (HDMI_FC_ACP1)

Configures the following contents of the Audio Content Packet (ACP) body:

- Address Offset: 0x1091 to 0x1082
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1091h offset = 12_1091h

Bit	7	6	5	4	3	2	1	0
Read Write	Audio_contentpacket							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_ACP1 field descriptions

Field	Description
Audio_ contentpacket	Audio content packet

33.5.125 FC_ISCR1_Frame Composer Packet Status, Valid, and Continue Configuration Register (HDMI_FC_ISCR1_0)

Configures the following contents of the ISRC1 packet:

- Address Offset: 0x1092
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, see the HDMI 1.4 specification.

Address: 12_0000h base + 1092h offset = 12_1092h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved			isrc_status[2:0]			isrc_valid	isrc_cont
Reset	0	0	0	0	0	0	0	0

HDMI_FC_ISCR1_0 field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
4–2 isrc_status[2:0]	Status of ISRC1.
1 isrc_valid	Valid of ISRC1.
0 isrc_cont	Indication of ISRC2.

33.5.126 Frame Composer ISCR1 Packet Body Register 1 (HDMI_FC_ISCR1_1)

Configures the following contents of the ISRC1 packet:

- ISRC1 packet body
- Address Offset: 0x10A2 to 0x1093
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, see the HDMI 1.4 specification.

Address: 12_0000h base + 1093h offset = 12_1093h

Bit	7	6	5	4	3	2	1	0
Read Write	isrc1							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_ISCR1_1 field descriptions

Field	Description
isrc1	Configures the contents of the ISRC1 packet:

33.5.127 Frame Composer ISCR2 Packet Body Register 0 (HDMI_FC_ISCR2_0)

Configures the following contents of the ISRC2 packet:

- ISRC2 packet body
- Address Offset: 0x10B2 to 0x10A3
- Size: 8 bits

- Value after Reset: 0x00
- Access: Read/Write

For more information, see the HDMI 1.4 specification.

Address: 12_0000h base + 10A3h offset = 12_10A3h

Bit	7	6	5	4	3	2	1	0
Read Write	isrc2							
Reset	0	0	0	0	0	0	0	0

HDMI_FC_ISCR2_0 field descriptions

Field	Description
isrc2	Configures the contents of the ISRC1 packet:

33.5.128 Frame Composer Data Island Auto Packet Scheduling Register 0 (HDMI_FC_DATAUTO0)

Configures the Frame Composer RDRB(1)/Manual(0) data island packet insertion for SPD, VSD, ISRC2, ISRC1 and ACP packets. On RDRB mode the described packet scheduling is controlled by registers FC_DATAUTO1 and FC_DATAUTO2, while in Manual mode register FC_DATMAN requests to FC the insertion of the requested packet.

- Address Offset: 0x10B3
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10B3h offset = 12_10B3h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved			spd_auto	vsd_auto	iscr2_auto	iscr1_auto	acp_auto
Reset	0	0	0	0	0	0	0	0

HDMI_FC_DATAUTO0 field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
4 spd_auto	Enables SPD automatic packet scheduling
3 vsd_auto	Enables VSD automatic packet scheduling

Table continues on the next page...

HDMI_FC_DATAUTO0 field descriptions (continued)

Field	Description
2 iscr2_auto	Enables ISRC2 automatic packet scheduling
1 iscr1_auto	Enables ISRC1 automatic packet scheduling
0 acp_auto	Enables ACP automatic packet scheduling

33.5.129 Frame Composer Data Island Auto Packet Scheduling Register 1 (HDMI_FC_DATAUTO1)

Configures the Frame Composer (FC) RDRB frame interpolation for SPD, VSD, ISRC2, ISRC1 and ACP packet insertion on data island when FC is on RDRB mode for the listed packets.

- Address Offset: 0x10B4
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10B4h offset = 12_10B4h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				AUTO_FRAME_INTERPOLATION			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_DATAUTO1 field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
AUTO_FRAME_ INTERPOLATION	Packet frame interpolation, for automatic packet scheduling

33.5.130 Frame Composer Data Island Auto Packet Scheduling Register 2 (HDMI_FC_DATAUTO2)

Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for SPD, VSD, ISRC2, ISRC1 and ACP packet insertion on data island when FC is on RDRB mode for the listed packets.

- Address Offset: 0x10B5

- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10B5h offset = 12_10B5h

Bit	7	6	5	4	3	2	1	0
Read Write	AUTO_FRAME_PACKETS				AUTO_LINE_SPACING			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_DATAUTO2 field descriptions

Field	Description
7–4 AUTO_FRAME_PACKETS	Packets per frame, for automatic packet scheduling
AUTO_LINE_SPACING	Packets line spacing, for automatic packet scheduling

33.5.131 Frame Composer Data Island Manual Packet Request Register (HDMI_FC_DATMAN)

Requests to the Frame Composer the data island packet insertion for NULL, SPD, VSD, ISRC2, ISRC1 and ACP packets when FC_DATAUTO0 bit is in manual mode for the packet requested.

- Address Offset: 0x10B6
- Size: 8 bits
- Value after Reset: 0x00
- Access: Write

Address: 12_0000h base + 10B6h offset = 12_10B6h

Bit	7	6	5	4	3	2	1	0
Read	Reserved							
Write			null_tx	spd_tx	vsd_tx	iscr2_tx	isr1_tx	acp_tx
Reset	0	0	0	0	0	0	0	0

HDMI_FC_DATMAN field descriptions

Field	Description
7–6 -	This field is reserved. Reserved
5 null_tx	Null packet

Table continues on the next page...

HDMI_FC_DATMAN field descriptions (continued)

Field	Description
4 spd_tx	SPD packet
3 vsd_tx	VSD packet
2 iscr2_tx	ISRC2 packet
1 isr1_tx	ISRC1 packet
0 acp_tx	ACP packet

33.5.132 Frame Composer Data Island Auto Packet Scheduling Register 3 (HDMI_FC_DATAUTO3)

Configures the Frame Composer Automatic(1)/RDRB(0) data island packet insertion for AVI, GCP, AUDI and ACR packets. In Automatic mode, the packet will be inserted on Vblanking when first line with active Vsync appears.

- Address Offset: 0x10B7
- Size: 8 bits
- Value after Reset: 0x0F
- Access: Read/Write

Address: 12_0000h base + 10B7h offset = 12_10B7h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				avi_auto	gcp_auto	audi_auto	acr_auto
Reset	0	0	0	0	1	1	1	1

Field	Description
7–4 -	This field is reserved. Reserved
3 avi_auto	Enable AVI packet insertion
2 gcp_auto	Enable GCP packet insertion
1 audi_auto	Enable AUDI packet insertion
0 acr_auto	Enable ACR packet insertion

33.5.133 Frame Composer Round Robin ACR Packet Insertion Register 0 (HDMI_FC_RDRB0)

Configures the Frame Composer (FC) RDRB frame interpolation for ACR packet insertion on data island when FC is on RDRB mode for this packet.

- Address Offset: 0x10B8
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10B8h offset = 12_10B8h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				ACRframeinterpolation			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_RDRB0 field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
ACRframeinterpolation	ACR frame interpolation

33.5.134 Frame Composer Round Robin ACR Packet Insertion Register 1 (HDMI_FC_RDRB1)

Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the ACR packet insertion on data island when FC is on RDRB mode this packet.

- Address Offset: 0x10B9
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10B9h offset = 12_10B9h

Bit	7	6	5	4	3	2	1	0
Read Write	ACRpacketsinframe				ACRpacketlinespacing			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_RDRB1 field descriptions

Field	Description
7–4 ACRpacketsinframe	ACR packets in frame
ACRpacketlinespacing	ACR packet line spacing

33.5.135 Frame Composer Round Robin ACR Packet Insertion Register 2 (HDMI_FC_RDRB2)

Configures the Frame Composer (FC) RDRB frame interpolation for AUDI packet insertion on data island when FC is on RDRB mode for this packet.

- Address Offset: 0x10BA
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10BAh offset = 12_10BAh

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				AUDIframeinterpolation			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_RDRB2 field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
AUDIframeinterpolation	Audio frame interpolation

33.5.136 Frame Composer Round Robin ACR Packet Insertion Register 3 (HDMI_FC_RDRB3)

Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the AUDI packet insertion on data island when FC is on RDRB mode this packet.

- Address Offset: 0x10BB
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10BBh offset = 12_10BBh

Bit	7	6	5	4	3	2	1	0
Read Write	AUDIpacketsinframe				AUDIpacketlinespacing			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_RDRB3 field descriptions

Field	Description
7–4 AUDIpacketsinframe	Audio packets per frame
AUDIpacketlinespacing	Audio packets line spacing

33.5.137 Frame Composer Round Robin ACR Packet Insertion Register 4 (HDMI_FC_RDRB4)

Configures the Frame Composer (FC) RDRB frame interpolation for GCP packet insertion on data island when FC is on RDRB mode for this packet.

- Address Offset: 0x10BC
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10BCh offset = 12_10BCh

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				GCPframeinterpolation			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_RDRB4 field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
GCPframeinterpolation	GCP packets line spacing

33.5.138 Frame Composer Round Robin ACR Packet Insertion Register 5 (HDMI_FC_RDRB5)

Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the GCP packet insertion on data island when FC is on RDRB mode this packet.

- Address Offset: 0x10BD

- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10BDh offset = 12_10BDh

Bit	7	6	5	4	3	2	1	0
Read Write	GCPpacketsinframe				GCPpacketlinespacing			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_RDRB5 field descriptions

Field	Description
7–4 GCPpacketsinframe	GCP packets per frame
GCPpacketlinespacing	GCP packets line spacing

33.5.139 Frame Composer Round Robin ACR Packet Insertion Register 6 (HDMI_FC_RDRB6)

Configures the Frame Composer (FC) RDRB frame interpolation for AVI packet insertion on data island when FC is on RDRB mode for this packet.

- Address Offset: 0x10BE
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10BEh offset = 12_10BEh

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				AVIframeinterpolation			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_RDRB6 field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
AVIframeinterpolation	GCP packets line spacing

33.5.140 Frame Composer Round Robin ACR Packet Insertion Register 7 (HDMI_FC_RDRB7)

Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the AVI packet insertion on data island when FC is on RDRB mode this packet.

- Address Offset: 0x10BF
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10BFh offset = 12_10BFh

Bit	7	6	5	4	3	2	1	0
Read Write	AVIpacketsinframe				AVIpacketlinespacing			
Reset	0	0	0	0	0	0	0	0

HDMI_FC_RDRB7 field descriptions

Field	Description
7–4 AVIpacketsinframe	AVI packets per frame
AVIpacketlinespacing	AVI packets line spacing

33.5.141 FC_STAT0 (HDMI_FC_STAT0)

Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the AVI packet insertion on data island when FC is on RDRB mode this packet.

- Address Offset: 0x10D0
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 10D0h offset = 12_10D0h

Bit	7	6	5	4	3	2	1	0
Read	AUDI	ACP	HBR	Reserved		AUDS	ACR	NULL
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_FC_STAT0 field descriptions

Field	Description
7 AUDI	Status bit Active after successful transmission of an Audio InfoFrame packet.
6 ACP	Status bit. Active after successful transmission of an Audio Content Protection Packet.
5 HBR	Status bit. Active after successful transmission of an Audio HBR packet
4–3 -	This field is reserved. Reserved
2 AUDS	Status bit Active after successful transmission of an Audio Sample packet.
1 ACR	Status bit Active after successful transmission of an Audio Clock Regeneration (N/CTS transmission) packet.
0 NULL	Status bit Active after successful transmission of an Null packet.

33.5.142 FC_INT0 (HDMI_FC_INT0)

This register contains the interrupt indication of the FC_STAT0 status interrupts. Interrupt generation is accomplished in the following way:

interrupt = (mask == 1'b0) && (polarity == status);

All this interrupts are forwarded to the Interrupt Handler sticky bit registers and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

- Address Offset: 0x10D1
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10D1h offset = 12_10D1h

Bit	7	6	5	4	3	2	1	0
Read Write	AUDI	ACP	HBR	Reserved		AUDS	ACR	NULL
Reset	0	0	0	0	0	0	0	0

HDMI_FC_INT0 field descriptions

Field	Description
7 AUDI	Interrupt indication bit

Table continues on the next page...

HDMI_FC_INT0 field descriptions (continued)

Field	Description
	Active after successful transmission of an Audio InfoFrame packet interrupt.
6 ACP	Interrupt indication bit Active after successful transmission of an Audio Content Protection packet interrupt.
5 HBR	Interrupt indication bit Active after successful transmission of a Audio HBR packet interrupt.
4–3 -	This field is reserved. Reserved
2 AUDS	Interrupt indication bit Active after successful transmission of an Audio Sample packet interrupt.
1 ACR	Interrupt indication bit Active after successful transmission of an Audio Clock Regeneration (N/CTS transmission) packet interrupt.
0 NULL	Interrupt indication bit Active after successful transmission of an Null packet interrupt.

33.5.143 Frame Composer Packet Interrupt Mask Register 0 (HDMI_FC_MASK0)

Mask register for generation of FC_INT0 interrupts.

- Address Offset: 0x10D2
- Size: 8 bits
- Value after Reset: 0x25
- Access: Read/Write

Address: 12_0000h base + 10D2h offset = 12_10D2h

Bit	7	6	5	4	3	2	1	0
Read Write	AUDI	ACP	HBR	Reserved		AUDS	ACR	NULL
Reset	0	0	1	0	0	1	0	1

HDMI_FC_MASK0 field descriptions

Field	Description
7 AUDI	Mask bit for FC_INT0.AUDI interrupt bit Value after Reset: 0b
6 ACP	Mask bit for FC_INT0.ACP interrupt bit Value after Reset: 0b
5 HBR	Mask bit for FC_INT0.HBR interrupt bit Value after Reset: 0b

Table continues on the next page...

HDMI_FC_MASK0 field descriptions (continued)

Field	Description
4–3 -	This field is reserved. Reserved
2 AUDS	Mask bit for FC_INT0.AUDS interrupt bit Value after Reset: 0b
1 ACR	Mask bit for FC_INT0.ACR interrupt bit Value after Reset: 0b
0 NULL	Mask bit for FC_INT0.NULL interrupt bit Value after Reset: 0b

33.5.144 FC_POL0 (HDMI_FC_POL0)

Polarity register for generation of FC_INT0 interrupts.

- Address Offset: 0x10D3
- Size: 8 bits
- Value after Reset: 0xFF
- Access: Read/Write

Address: 12_0000h base + 10D3h offset = 12_10D3h

Bit	7	6	5	4	3	2	1	0
Read Write	AUDI	ACP	HBR	Reserved		AUDS	ACR	NULL
Reset	1	1	1	1	1	1	1	1

HDMI_FC_POL0 field descriptions

Field	Description
7 AUDI	Polarity bit for FC_INT0.AUDI interrupt bit Value after Reset: 0b
6 ACP	Polarity bit for FC_INT0.ACP interrupt bit Value after Reset: 0b
5 HBR	Polarity bit for FC_INT0.HBR interrupt bit Value after Reset: 0b
4–3 -	This field is reserved. Reserved
2 AUDS	Polarity bit for FC_INT0.AUDS interrupt bit Value after Reset: 0b
1 ACR	Polarity bit for FC_INT0.ACR interrupt bit Value after Reset: 0b
0 NULL	Polarity bit for FC_INT0.NULL interrupt bit Value after Reset: 0b

33.5.145 FC_STAT1 (HDMI_FC_STAT1)

This register contains the following active high packet sent status indications:

- Address Offset: 0x10D4
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10D4h offset = 12_10D4h

Bit	7	6	5	4	3	2	1	0
Read Write	GMD	ISCR1	ISCR2	VSD	SPD	Reserved	AVI	GCP
Reset	0	0	0	0	0	0	0	0

HDMI_FC_STAT1 field descriptions

Field	Description
7 GMD	Status bit Active after successful transmission of an Gamut metadata packet.
6 ISCR1	Status bit Active after successful transmission of an International Standard Recording Code 1 packet.
5 ISCR2	Active after successful transmission of an International Standard Recording Code 2 packet.
4 VSD	Active after successful transmission of an Vendor Specific Data infoFrame packet.
3 SPD	Active after successful transmission of an Source Product Descriptor infoFrame packet.
2 -	This field is reserved. Reserved
1 AVI	Status bit Active after successful transmission of an AVI infoFrame packet.
0 GCP	Status bit Active after successful transmission of an General Content Packet.

33.5.146 FC_INT1 (HDMI_FC_INT1)

This register contains the interrupt indication of the FC_STAT1 status interrupts. Interrupt generation is accomplished in the following way:

interrupt = (mask == 1'b0) && (polarity == status);

All this interrupts are forwarded to the Interrupt Handler sticky bit registers and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

- Address Offset: 0x10D5
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10D5h offset = 12_10D5h

Bit	7	6	5	4	3	2	1	0
Read Write	GMD	ISCR1	ISCR2	VSD	SPD	Reserved	AVI	GCP
Reset	0	0	0	0	0	0	0	0

HDMI_FC_INT1 field descriptions

Field	Description
7 GMD	Interrupt indication bit Active after successful transmission of an Gamut metadata packet interrupt.
6 ISCR1	Interrupt indication bit Active after successful transmission of an International Standard Recording Code 1 packet interrupt.
5 ISCR2	Interrupt indication bit Active after successful transmission of an International Standard Recording Code 2 packet interrupt.
4 VSD	Interrupt indication bit Active after successful transmission of an Vendor Specific Data infoFrame packet interrupt.
3 SPD	Interrupt indication bit Active after successful transmission of an Source Product Descriptor infoFrame packet interrupt.
2 -	This field is reserved. Reserved
1 AVI	Interrupt indication bit Active after successful transmission of an AVI infoFrame packet interrupt.
0 GCP	Interrupt indication bit Active after successful transmission of an General Content Packet interrupt.

33.5.147 Frame Composer Packet Interrupt Mask Register 1 (HDMI_FC_MASK1)

Mask register for generation of FC_INT1 interrupts.

- Address Offset: 0x10D6

- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10D6h offset = 12_10D6h

Bit	7	6	5	4	3	2	1	0
Read Write	GMD	ISCR1	ISCR2	VSD	SPD	Reserved	AVI	GCP
Reset	0	0	0	0	0	0	0	0

HDMI_FC_MASK1 field descriptions

Field	Description
7 GMD	Mask bit for FC_INT1.GMD interrupt bit
6 ISCR1	Mask bit for FC_INT1.ISRC1 interrupt bit
5 ISCR2	Mask bit for FC_INT1.ISRC2 interrupt bit
4 VSD	Mask bit for FC_INT1.VSD interrupt bit
3 SPD	Mask bit for FC_INT1.SPD interrupt bit
2 -	This field is reserved. Reserved
1 AVI	Mask bit for FC_INT1.AVI interrupt bit
0 GCP	Mask bit for FC_INT1.GCP interrupt bit

33.5.148 FC_POL1 (HDMI_FC_POL1)

Polarity register for generation of FC_INT1 interrupts.

- Address Offset: 0x10D7
- Size: 8 bits
- Value after Reset: 0xFF
- Access: Read/Write

Address: 12_0000h base + 10D7h offset = 12_10D7h

Bit	7	6	5	4	3	2	1	0

HDMI_FC_POL1 field descriptions

Field	Description
7 GMD	Polarity bit for FC_INT1.GMD interrupt bit
6 ISCR1	Polarity bit for FC_INT1.ISRC1 interrupt bit
5 ISCR2	Polarity bit for FC_INT1.ISRC2 interrupt bit
4 VSD	Polarity bit for FC_INT1.VSD interrupt bit
3 SPD	Polarity bit for FC_INT1.SPD interrupt bit
2 -	This field is reserved. Reserved
1 AVI	Polarity bit for FC_INT1.AVI interrupt bit
0 GCP	Polarity bit for FC_INT1.GCP interrupt bit

33.5.149 FC_STAT2 (HDMI_FC_STAT2)

This register contains the following active high packet sent status indications:

- Address Offset: 0x10D8
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10D8h offset = 12_10D8h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved						LowPriority_ overflow	HighPriority _overflow
Reset	0	0	0	0	0	0	0	0

HDMI_FC_STAT2 field descriptions

Field	Description
7–2 -	This field is reserved. Reserved
1 LowPriority_ overflow	Status bit Frame Composer low priority packet queue descriptor overflow indication.
0 HighPriority_ overflow	Status bit Frame Composer high priority packet queue descriptor overflow indication.

33.5.150 FC_INT2 (HDMI_FC_INT2)

This register contains the interrupt indication of the FC_STAT2 status interrupts. Interrupt generation is accomplished in the following way:

interrupt = (mask == 1'b0) && (polarity == status);

All this interrupts are forwarded to the Interrupt Handler sticky bit registers and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

- Address Offset: 0x10D9
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10D9h offset = 12_10D9h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved						LowPriority_ overflow	HighPriority _overflow
Reset	0	0	0	0	0	0	0	0

HDMI_FC_INT2 field descriptions

Field	Description
7–2 -	This field is reserved. Reserved
1 LowPriority_ overflow	Interrupt indication bit Frame Composer low priority packet queue descriptor overflow indication interrupt.
0 HighPriority_ overflow	Interrupt indication bit Frame Composer high priority packet queue descriptor overflow indication interrupt.

33.5.151 Frame Composer High/Low Priority Overflow Interrupt Mask Register 2 (HDMI_FC_MASK2)

Mask register for generation of FC_INT2 interrupts.

- Address Offset: 0x10DA
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 10DAh offset = 12_10DAh

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved						LowPriority_ overflow	HighPriority _overflow
Reset	0	0	0	0	0	0	0	0

HDMI_FC_MASK2 field descriptions

Field	Description
7–2 -	This field is reserved. Reserved
1 LowPriority_ overflow	Mask bit for FC_INT1.LowPriority_overflow interrupt bit Value after Reset: 0b
0 HighPriority_ overflow	Mask bit for FC_INT1.HighPriority_overflow interrupt bit Value after Reset: 0b

33.5.152 FC_POL2 (HDMI_FC_POL2)

Polarity register for generation of FC_INT2 interrupts.

- Address Offset: 0x10DB
- Size: 8 bits
- Value after Reset: 0x03
- Access: Read/Write

Address: 12_0000h base + 10DBh offset = 12_10DBh

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved						LowPriority_ overflow	HighPriority _overflow
Reset	0	0	0	0	0	0	1	1

HDMI_FC_POL2 field descriptions

Field	Description
7–2 -	This field is reserved. Reserved
1 LowPriority_ overflow	Polarity bit for FC_INT1.LowPriority_overflow interrupt bit Value after Reset: 1b
0 HighPriority_ overflow	Polarity bit for FC_INT1.HighPriority_overflow interrupt bit Value after Reset: 1b

33.5.153 Frame Composer Pixel Repetition Configuration Register (HDMI_FC_PRCONF)

Defines the Pixel Repetition ratio factor of the input and output video signal.

- Address Offset: 0x10E0
- Size: 8 bits
- Value after Reset: 0x10
- Access: Read/Write

Address: 12_0000h base + 10E0h offset = 12_10E0h

Bit	7	6	5	4	3	2	1	0
Read Write	incoming_pr_factor[3:0]				output_pr_factor[3:0]			
Reset	0	0	0	1	0	0	0	0

HDMI_FC_PRCONF field descriptions

Field	Description
7–4 incoming_pr_factor[3:0]	Configures the input video pixel repetition. A plus 1 factor should be added in this register configuration. For CEA modes this value should be extracted from the CEA spec for the video mode being inputted. **NOTE:** When working in YCC422 video the actual repetition of the stream will be Incoming_pr_factor * (desired_pr_factor + 1). This calculation is done internally in the H13TCTRL and no HW overflow protection is available. Care must be taken to avoid this result passes the maximum number of 10 pixels repeated since no HDMI support is available for this in the spec and the H13TPHY does not support this higher repetition values. other: Reserved. Not used. 0000 No action. Shall not be used. 0001 No pixel repetition (pixel sent only once). 0010 Pixel sent twice (pixel repeated once). 0011 Pixel sent 3 times. 0100 Pixel sent 4 times. 0101 Pixel sent 5 times. 0110 Pixel sent 6 times. 0111 Pixel sent 7 times. 1000 Pixel sent 8 times. 1001 Pixel sent 9 times. 1010 Pixel sent 10 times.
output_pr_factor[3:0]	Configures the video pixel repetition ratio to be sent on the AVI infoFrame. This value must be valid according to HDMI spec. The output_pr_factor = incoming_pr_factor(without the + 1 factor) * desired_pr_factor. other: Reserved. Not used. 0000 No action. Shall not be used. 0001 Pixel sent twice (pixel repeated once). 0010 Pixel sent 3 times. 0011 Pixel sent 4 times.

Table continues on the next page...

HDMI_FC_PRCONF field descriptions (continued)

Field	Description
	0100 Pixel sent 5 times. 0101 Pixel sent 6 times. 0110 Pixel sent 7 times. 0111 Pixel sent 8 times. 1000 Pixel sent 9 times. 1001 Pixel sent 10 times.

33.5.154 Frame Composer GMD Packet Status Register (HDMI_FC_GMD_STAT)

Gamut metadata packet status bit information for no_current_gmd, next_gmd_field, gmd_packet_sequence and current_gamut_seq_num. For more information, refer to the HDMI 1.4a specification.

- Address Offset: 0x1100
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 1100h offset = 12_1100h

Bit	7	6	5	4
Read	igmdno_crnt_gbd	igmddnext_field	igmdpacket_seq[1:0]	
Write				
Reset	0	0	0	0

Bit	3	2	1	0
Read	igmdcurrent_gamut_seq_num[3:0]			
Write				
Reset	0	0	0	0

HDMI_FC_GMD_STAT field descriptions

Field	Description
7 igmdno_crnt_gbd	Gamut scheduling: No current gamut data
6 igmddnext_field	Gamut scheduling: Gamut Next field
5–4 igmdpacket_seq[1:0]	Gamut scheduling: Gamut packet sequence
igmdcurrent_gamut_seq_num[3:0]	Gamut scheduling: Current Gamut packet sequence number

33.5.155 Frame Composer GMD Packet Enable Register (HDMI_FC_GMD_EN)

This register enables Gamut metadata (GMD) packet transmission. Packets are inserted in the incoming frame, starting in the line where active Vsync indication starts. After enable of GMD packets the outgoing packet is sent with no_current_gmd active indication until update GMD request is performed in the controller.

- Address Offset: 0x1101
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1101h offset = 12_1101h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved							gmdenabletx
Reset	0	0	0	0	0	0	0	0

HDMI_FC_GMD_EN field descriptions

Field	Description
7–1 -	This field is reserved. Reserved
0 gmdenabletx	Gamut Metadata packet transmission enable (1b).

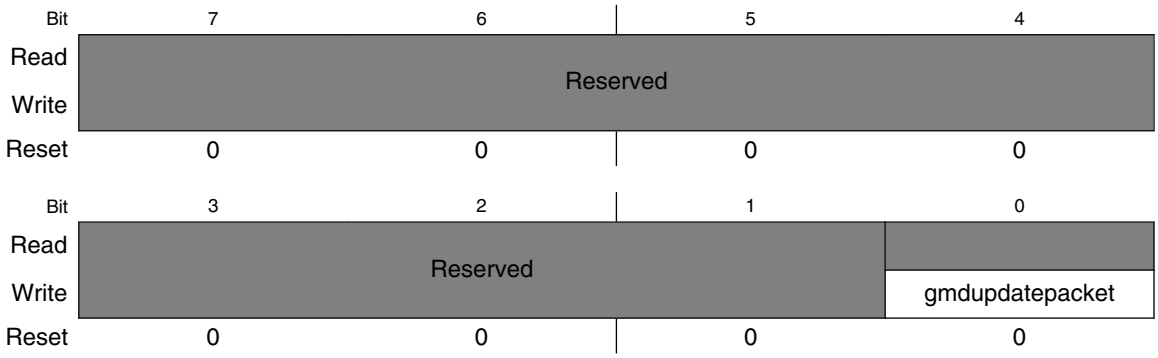
33.5.156 Frame Composer GMD Packet Update Register (HDMI_FC_GMD_UP)

This register performs an GMD packet content update according to the configured packet body (FC_GMD_PB0 to FC_GMD_PB27) and packet header (FC_GMD_HB). This active high auto clear register reflects the body and header configurations on the GMD packets sent arbitrating the current_gamut_seq_num, gmd_packet_sequence and next_gmd_field bits on packet to correctly indicate to source the Gamut change to be performed. After enable GMD packets the first update request is also responsible for deactivating the no_current_gmd indication bit. Attention packet update request must only be done after correct configuration of GMD packet body and header registers. Correct affected_gamut_seq_num and gmd_profile configuration is user responsibility and must convey with HDMI 1.4a standard gamut rules.

- Address Offset: 0x1102

- Size: 8 bits
- Value after Reset: 0x00
- Access: Write

Address: 12_0000h base + 1102h offset = 12_1102h



HDMI_FC_GMD_UP field descriptions

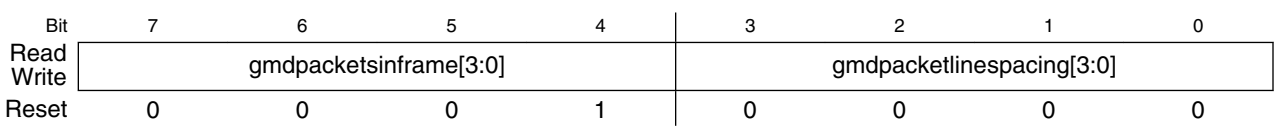
Field	Description
7–1 -	This field is reserved. Reserved
0 gmdupdatepacket	Gamut Metadata packet update.

33.5.157 Frame Composer GMD Packet Schedule Configuration Register (HDMI_FC_GMD_CONF)

This register configures the number of GMD packets to be inserted per frame (starting always in the line where the active Vsync appears) and the line spacing between the transmitted GMD packets. Note that for profile P0 (refer to HDMI 1.4a spec) this register should only indicate one GMD packet to be inserted per video field.

- Address Offset: 0x1103
- Size: 8 bits
- Value after Reset: 0x10
- Access: Read/Write

Address: 12_0000h base + 1103h offset = 12_1103h



HDMI_FC_GMD_CONF field descriptions

Field	Description
7–4 gmdpacketsinframe[3:0]	Number of GMD packets per frame or video field (profile P0)
gmdpacketlinespacing[3:0]	Number of line spacing between the transmitted GMD packets

33.5.158 Frame Composer GMD Packet Profile and Gamut Sequence Configuration Register (HDMI_FC_GMD_HB)

This register configures the GMD packet header affected_gamut_seq_num and gmd_profile bits. For more information, refer to the HDMI 1.4a specification.

- Address Offset: 0x1104
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1104h offset = 12_1104h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved	gmdgbd_profile			gmdaffected_gamut_seq_num			
Reset	0	0	0	0	0	0	0	0

33.5.187 Frame Composer Video/Audio Force Enable Register (HDMI_FC_DBGFORCE)

This register allows to force the controller to output audio and video data the values configured in the FC_DBGAUD and FC_DBGTMDS registers.

- Address Offset: 0x1200
- Size: 8 bits

- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1200h offset = 12_1200h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved			forceaudio	Reserved			forcevideo
Reset	0	0	0	0	0	0	0	0

HDMI_FC_DBGFORCE field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
4 forceaudio	Force fixed audio output with FC_DBGAUDxCHx registers contain.
3–1 -	This field is reserved. Reserved
0 forcevideo	Force fixed video output with FC_DBGTMDSx registers contain.

33.5.188 Frame Composer Audio Channel 0 Register 0 (HDMI_FC_DBGAUD0CH0)

Configures the audio fixed data to be used in channel 0 when in fixed audio selection.

- Address Offset: 0x1201
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 1201h offset = 12_1201h

Bit	7	6	5	4	3	2	1	0

HDMI_PHY_TST0 field descriptions

Field	Description
7–6 -	This field is reserved. Reserved
5 testclr	Enable TMDS drivers, bias and tmds digital logic. Value after Reset: 0b
4 testen	Reserved. Spare control pins. Value after Reset: 0b
3–1 -	This field is reserved. Reserved
0 testclk	Test clock signal. Value after Reset: 0b

33.5.217 PHY Test Interface Register 1 (HDMI_PHY_TST1)

PHY TX mapped text interface (data in). For more information, refer to the DesignWare Cores HDMI TX PHY Databook.

- Address Offset: 0x3002
- Size: 8 bits

- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3002h offset = 12_3002h

Bit	7	6	5	4	3	2	1	0
Read Write	testdin[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_TST1 field descriptions

Field	Description
testdin[7:0]	Test data input.

33.5.218 PHY Test Interface Register 2 (HDMI_PHY_TST2)

PHY TX mapped text interface (data out). For more information, refer to the DesignWare Cores HDMI TX PHY Databook.

- Address Offset: 0x3003
- Size: 8 bits
- Value after Reset: N/A
- Access: Read

Address: 12_0000h base + 3003h offset = 12_3003h

Bit	7	6	5	4	3	2	1	0
Read	testdout[7:0]							
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_TST2 field descriptions

Field	Description
testdout[7:0]	Test data output.

33.5.219 PHY RXSENSE, PLL lock, and HPD Status Register (HDMI_PHY_STAT0)

This register contains the following active high packet sent status indications. For more information, see Overview

- Address Offset: 0x3004
- Size: 8 bits

- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 3004h offset = 12_3004h

Bit	7	6	5	4
Read	RX_SENSE3	RX_SENSE2	RX_SENSE1	RX_SENSE0
Write				
Reset	0	0	0	0

Bit	3	2	1	0
Read	Reserved		HPD	TX_PHY_LOCK
Write				
Reset	0	0	0	0

HDMI_PHY_STAT0 field descriptions

Field	Description
7 RX_SENSE3	Status bit. TX PHY RX_SENSE indication for TMDS CLK driver. User may need to mask or change polarity of this interrupt after it has became active.
6 RX_SENSE2	Status bit. TX PHY RX_SENSE indication for TMDS channel 2 driver. User may need to mask or change polarity of this interrupt after it has became active.
5 RX_SENSE1	Status bit. TX PHY RX_SENSE indication for TMDS channel 1 driver. User may need to mask or change polarity of this interrupt after it has became active.
4 RX_SENSE0	Status bit. TX PHY RX_SENSE indication for TMDS channel 0 driver. User may need to mask or change polarity of this interrupt after it has became active.
3–2 -	This field is reserved. Reserved
1 HPD	Status bit. HDMI Hot Plug Detect indication. User may need to mask or change polarity of this interrupt after it has became active.
0 TX_PHY_LOCK	Status bit. TX PHY PLL lock indication. Please refer to PHY datasheet for more information. User may need to mask or change polarity of this interrupt after it has became active.

33.5.220 PHY RXSENSE, PLL lock, and HPD Interrupt Register (HDMI_PHY_INT0)

This register contains the interrupt indication of the PHY_STAT0 status interrupts. Interrupt generation is accomplished in the following way:

interrupt = (mask == 1'b0) && (polarity == status);

All this interrupts are forwarded to the Interrupt Handler sticky bit registers and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

- Address Offset: 0x3005

- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 3005h offset = 12_3005h

Bit	7	6	5	4
Read	RX_SENSE3	RX_SENSE2	RX_SENSE1	RX_SENSE0
Write				
Reset	0	0	0	0

Bit	3	2	1	0
Read	Reserved		HPD	TX_PHY_LOCK
Write				
Reset	0	0	0	0

HDMI_PHY_INT0 field descriptions

Field	Description
7 RX_SENSE3	Interrupt indication bit TX PHY RX_SENSE indication interrupt for TMDS CLK driver.
6 RX_SENSE2	Interrupt indication bit TX PHY RX_SENSE indication interrupt for TMDS channel 2 driver.
5 RX_SENSE1	Interrupt indication bit TX PHY RX_SENSE indication interrupt for TMDS channel 1 driver.
4 RX_SENSE0	Interrupt indication bit TX PHY RX_SENSE indication interrupt for TMDS channel 0 driver.
3–2 -	This field is reserved. Reserved
1 HPD	Interrupt indication bit HDMI Hot Plug Detect indication interrupt.
0 TX_PHY_LOCK	Interrupt indication bit TX PHY PLL lock indication interrupt.

33.5.221 PHY RXSENSE, PLL lock, and HPD Mask Register (HDMI_PHY_MASK0)

Mask register for generation of PHY_INT0 interrupts.

- Address Offset: 0x3006
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3006h offset = 12_3006h

Bit	7	6	5	4	3	2	1	0
Read Write	RX_ SENSE3	RX_ SENSE2	RX_ SENSE1	RX_ SENSE0	Reserved		HPD	TX_PHY_ LOCK
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_MASK0 field descriptions

Field	Description
7 RX_SENSE3	Mask bit for PHY_INT0.RX_SENSE3 interrupt bit
6 RX_SENSE2	Mask bit for PHY_INT0.RX_SENSE2 interrupt bit
5 RX_SENSE1	Mask bit for PHY_INT0.RX_SENSE1 interrupt bit
4 RX_SENSE0	Mask bit for PHY_INT0.RX_SENSE0 interrupt bit
3–2 -	This field is reserved. Reserved
1 HPD	Mask bit for PHY_INT0.HPD interrupt bit
0 TX_PHY_LOCK	Mask bit for PHY_INT0.TX_PHY_LOCK interrupt bit

33.5.222 PHY RXSENSE, PLL lock and HPD Polarity Register (HDMI_PHY_POL0)

Polarity register for generation of PHY_INT0 interrupts.

- Address Offset: 0x3007
- Size: 8 bits
- Value after Reset: 0xF3
- Access: Read/Write

Address: 12_0000h base + 3007h offset = 12_3007h

Bit	7	6	5	4	3	2	1	0
Read Write	RX_ SENSE3	RX_ SENSE2	RX_ SENSE1	RX_ SENSE0	Reserved		HPD	TX_PHY_ LOCK
Reset	1	1	1	1	0	0	1	1

HDMI_PHY_POL0 field descriptions

Field	Description
7 RX_SENSE3	Polarity bit for PHY_INT0.RX_SENSE3 interrupt bit

Table continues on the next page...

HDMI_PHY_POL0 field descriptions (continued)

Field	Description
6 RX_SENSE2	Polarity bit for PHY_INT0.RX_SENSE2 interrupt bit
5 RX_SENSE1	Polarity bit for PHY_INT0.RX_SENSE1 interrupt bit
4 RX_SENSE0	Polarity bit for PHY_INT0.RX_SENSE0 interrupt bit
3–2 -	This field is reserved. Reserved
1 HPD	Polarity bit for PHY_INT0.HPD interrupt bit
0 TX_PHY_LOCK	Polarity bit for PHY_INT0.TX_PHY_LOCK interrupt bit

33.5.223 PHY I2C Slave Address Configuration Register (HDMI_PHY_I2CM_SLAVE_ADDR)

This register writes the slave address of the I2C Master PHY.

- Address Offset: 0x3020
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3020h offset = 12_3020h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved	-						
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_I2CM_SLAVE_ADDR field descriptions

Field	Description
7 -	This field is reserved. Reserved
-	Slave address to be sent during read and write operations. The PHY Gen2 slave address is: 7'h69 The HEAC PHY slave address is: 7'h49

33.5.224 PHY I2C Address Configuration Register (HDMI_PHY_I2CM_ADDRESS_ADDR)

This register writes the address for read and writer operations.

- Address Offset: 0x3021
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3021h offset = 12_3021h

Bit	7	6	5	4	3	2	1	0
Read Write	address							
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_I2CM_ADDRESS_ADDR field descriptions

Field	Description
address	Register address for read and write operations.

33.5.225 PHY I2C Data Write Register 1 (HDMI_PHY_I2CM_DATAO_1_ADDR)

- Address Offset: 0x3022
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3022h offset = 12_3022h

Bit	7	6	5	4	3	2	1	0
Read Write	datao[15:8]							
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_I2CM_DATAO_1_ADDR field descriptions

Field	Description
datao[15:8]	MSB's of data to be written on register pointed by address [7:0].

33.5.226 PHY I2C Data Write Register 0 (HDMI_PHY_I2CM_DATAO_0_ADDR)

- Address Offset: 0x3023
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3023h offset = 12_3023h

Bit	7	6	5	4	3	2	1	0
Read Write	datao[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_I2CM_DATAO_0_ADDR field descriptions

Field	Description
datao[7:0]	LSB's of data to be written on register pointed by address [7:0].

33.5.227 PHY I2C Data Read Register 1 (HDMI_PHY_I2CM_DATAI_1_ADDR)

- Address Offset: 0x3024
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 3024h offset = 12_3024h

Bit	7	6	5	4	3	2	1	0
Read	datai[15:8]							
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_I2CM_DATAI_1_ADDR field descriptions

Field	Description
datai[15:8]	MSB's of data read from the register pointed by address [7:0].

33.5.228 PHY I2C Data Read Register 0 (HDMI_PHY_I2CM_DATAI_0_ADDR)

- Address Offset: 0x3025
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 3025h offset = 12_3025h

Bit	7	6	5	4	3	2	1	0
Read Write	datai[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_I2CM_DATAI_0_ADDR field descriptions

Field	Description
datai[7:0]	LSB's of data read from the register pointed by address [7:0].

33.5.229 PHY I2C Read/Write Operation (HDMI_PHY_I2CM_OPERATION_ADDR)

This register requests read and write operations from the I2C Master PHY. This register can only be written; reading this register always results in 00h. Writing 1'b1 simultaneously to read and write requests is considered a read request.

- Address Offset: 0x3026
- Size: 8 bits
- Value after Reset: 0x00
- Access: Write

Address: 12_0000h base + 3026h offset = 12_3026h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				Reserved			
Write				write				read
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_I2CM_OPERATION_ADDR field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
4 write	Write operation request
3–1 -	This field is reserved. Reserved
0 read	Read operation request.

33.5.230 PHY I2C Done Interrupt Register (HDMI_PHY_I2CM_INT_ADDR)

This register contains and configures I2C master PHY done interrupt.

- Address Offset: 0x3027
- Size: 8 bits
- Value after Reset: 0x08
- Access: Read/Write

Address: 12_0000h base + 3027h offset = 12_3027h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				done_pol	done_mask	done_ interrupt	done_status
Reset	0	0	0	0	1	0	0	0

HDMI_PHY_I2CM_INT_ADDR field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
3 done_pol	Done interrupt polarity configuration Value after Reset: 1b
2 done_mask	Done interrupt mask signal Value after Reset: 0b
1 done_interrupt	Operation done interrupt bit.{done_interrupt =(done_mask==0b)&& (done_status==done_pol)}. Value after Reset: 0b
0 done_status	Operation done status bit.Marks the end of a rd or write operation. Value after Reset: 0b

33.5.231 PHY I2C Done Interrupt Register (HDMI_PHY_I2CM_CTLINT_ADDR)

This register contains and configures the I2C master PHY error interrupts.

- Address Offset: 0x3028
- Size: 8 bits
- Value after Reset: 0x88
- Access: Read/Write

Address: 12_0000h base + 3028h offset = 12_3028h

Bit	7	6	5	4
Read Write	nack_pol	nack_mask	nack_interrupt	nack_status
Reset	1	0	0	0

Bit	3	2	1	0
Read Write	arbitration_pol	arbitration_mask	arbitration_interrupt	arbitration_status
Reset	1	0	0	0

HDMI_PHY_I2CM_CTLINT_ADDR field descriptions

Field	Description
7 nack_pol	Not acknowledge error interrupt polarity configuration. Value after Reset: 1b
6 nack_mask	Not acknowledge error interrupt mask signal Value after Reset: 0b
5 nack_interrupt	Not acknowledge error interrupt bit.{nack_interrupt = nack_mask==0b) && (nack_status==nack_pol)}. Value after Reset: 0b
4 nack_status	Not acknowledge error status bit.Error on I2C not acknowledge. Value after Reset: 0b
3 arbitration_pol	Arbitration error interrupt polarity configuration. Value after Reset: 1b
2 arbitration_mask	Arbitration error interrupt mask signal. Value after Reset: 0b
1 arbitration_ interrupt	Arbitration error interrupt bit.{arbitration_interrupt = (arbitration_mask==0b)&& (arbitration_status==arbitration_pol)}. Value after Reset: 0b
0 arbitration_status	Arbitration error status bit. Error on master I2C protocol arbitration. Value after Reset: 0b

33.5.232 PHY I2C Speed Control Register (HDMI_PHY_I2CM_DIV_ADDR)

This register wets the I2C Master PHY to work in either Fast or Standard mode.

- Address Offset: 0x3029
- Size: 8 bits
- Value after Reset: 0x0B
- Access: Read/Write

Address: 12_0000h base + 3029h offset = 12_3029h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				fast_mode			
Reset	0	0	0	0	1	0	1	1

HDMI_PHY_I2CM_DIV_ADDR field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
fast_mode	Sets the I2C Master to work in Fast Mode or Standard Mode (x implies that it can take any value) Value after Reset: 1011b 1xxxb Fast Mode 0xxxb Standard Mode

33.5.233 PHY I2C Software Reset Register (HDMI_PHY_I2CM_SOFTRSTZ_ADDR)

This register sets the I2C Master PHY software reset.

- Address Offset: 0x302A
- Size: 8 bits
- Value after Reset: 0x01
- Access: Read/Write

The following *CNT registers must be set before any I2C bus transaction can take place to ensure proper I/O timing.

The following are the I2C Master SCL clock settings:

- SS: Standard Speed

- FS: Fast Speed
- HCNT: SCL High Level counter
- LCNT: SCL Low Level counter

Address: 12_0000h base + 302Ah offset = 12_302Ah

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved							i2c_softrst
Reset	0	0	0	0	0	0	0	1

HDMI_PHY_I2CM_SOFTRSTZ_ADDR field descriptions

Field	Description
7–1 -	This field is reserved. Reserved
0 i2c_softrst	I2C Master PHY Software Reset. Active by writing a zero and auto cleared to one in the following cycle. Value after Reset: 1b

33.5.234 PHY I2C Slow Speed SCL High Level Control Register 1 (HDMI_PHY_I2CM_SS_SCL_HCNT_1_ADDR)

- Address Offset: 0x302B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 302Bh offset = 12_302Bh

AudN[19:16]	HDMI Audio Clock Regenerator N value

33.5.245 AUD_CTS1 (HDMI_AUD_CTS1)

For CTS expected values, refer to the HDMI 1.4a specification.

- Address Offset: 0x3203
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3203h offset = 12_3203h

Bit	7	6	5	4	3	2	1	0
Read Write	audCTS[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_AUD_CTS1 field descriptions

Field	Description
audCTS[7:0]	HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual (AUD_CTS3) mechanism.

33.5.246 AUD_CTS2 (HDMI_AUD_CTS2)

For CTS expected values, refer to the HDMI 1.4a specification.

- Address Offset: 0x3204
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3204h offset = 12_3204h

Bit	7	6	5	4	3	2	1	0
Read Write	audCTS[15:8]							
Reset	0	0	0	0	0	0	0	0

HDMI_AUD_CTS2 field descriptions

Field	Description
audCTS[15:8]	HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual (AUD_CTS3) mechanism.

33.5.247 AUD_CTS3 (HDMI_AUD_CTS3)

For CTS expected values, refer to the HDMI 1.4a specification.

- Address Offset: 0x3205
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3205h offset = 12_3205h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				audCTS[19:16]			
Reset	0	0	0	0	0	0	0	0

HDMI_AUD_CTS3 field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
audCTS[19:16]	HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual (AUD_CTS3) mechanism.

33.5.248 Audio DMA Start Register (HDMI_AHB_DMA_CONF0)

This register contains the software reset bit for the audio FIFOs. It also configures operating modes of the AHB master.

- Address Offset: 0x3600
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3600h offset = 12_3600h

Bit	7	6	5	4	3	2	1	0
Read Write	sw_fifo_rst	Reserved		hbr	enable_ hlock	incr_type[1:0]		burst_mode
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_CONF0 field descriptions

Field	Description
7 sw_fifo_rst	This is the software reset bit for the audio and FIFOs clear. Writing 0'b does not result in any action.

Table continues on the next page...

HDMI_AHB_DMA_CONF0 field descriptions (continued)

Field	Description
	Writing 1'b to this register resets all audio FIFOs. Reading from this register always returns 0'b.
6–5 -	This field is reserved. Reserved
4 hbr	HBR packets enable. The HDMI TX sends the HBR packets. This bit is enabled when the audio frequency is higher than 192 KHz. If this bit is enabled, the number of channels configured in AHB_DMA_CONF1 is always 8.
3 enable_hlock	Enable request of locked burst AHB mechanism. 1 Enables the usage of ohlock for master request to arbiter of a locked complete burst.\ 0 Disables request of locked burst AHB mechanism
2–1 incr_type[1:0]	Forced size burst mode. 00 Corresponds to INCR4 fixed four beat incremental AHB burst mode. Only valid when burst_mode is high. 01 Corresponds to INCR8 fixed eight beat incremental AHB burst mode. Only valid when burst_mode is high. 10 Corresponds to INCR16 fixed 16 beat incremental AHB burst mode. Only valid when burst_mode is high. 11 Corresponds to INCR16 fixed 16 beat incremental AHB burst mode. Only valid when burst_mode is high.
0 burst_mode	Burst mode bit 1 Forces the burst mode to be fixed beat incremental burst mode designated by the incr_type[1:0] signal. 0 Normal operation is unspecified length incremental burst. It corresponds to INCR AHB burst mode.

33.5.249 AHB_DMA_START (HDMI_AHB_DMA_START)

The data_ buffer_ready bit field signals the AHB audio DMA to start accessing system memory in order to fetch data samples to store in the FIFO. After the operation starts, a new request for a DMA start is ignored until the DMA is stopped or it reaches the end address. Only in one of these situations will a new start request be acknowledged.

The first DMA burst request after data_buffer_ready configuration uses the initial_addr[31:0] as the ohaddr[31:0] and the MBURSTLENGTH[10:0] = AUDIO_FIFO_DEPTH if AUDIO_FIFO_DEPTH < 1024 or MBURSTLENGTH[10:0] = 1024 if AUDIO_FIFO_DEPTH >= 1024.

- Address Offset: 0x3601
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3601h offset = 12_3601h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved							data_buffer_ready
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_START field descriptions

Field	Description
7–1 -	This field is reserved. Reserved
0 data_buffer_ready	Data buffer ready

33.5.250 Audio DMA Stop Register (HDMI_AHB_DMA_STOP)

The stop_dma_transaction bit field signals the AHB audio DMA to stop current memory access. After it stops, if a new start DMA operation is requested, the DMA engine restarts the memory access assuming the initial_addr[31:0] is programmed at AHB_DMA_STRADDR0 to AHB_DMA_STRADDR3.

- Address Offset: 0x3602
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3602h offset = 12_3602h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved							stop_dma_transaction
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_STOP field descriptions

Field	Description
7–1 -	This field is reserved. Reserved
0 stop_dma_transaction	Stop DMA transaction

33.5.251 Audio DMA FIFO Threshold Register (HDMI_AHB_DMA_THRSLD)

This register defines the FIFO medium threshold occupation value.

After the AHB master successfully completes a burst transaction, the FIFO may stay remain full until the data fetch interface requests samples. The sample request from the FIFO using the data fetch mechanism drops the number of samples stored in the audio FIFO.

As soon as the number of samples in the FIFO drops lower than the fifo_threshold[7:0], the DMA engine requests a new burst of samples to the AHB master with a size (MBURSTLENGTH[10:0]) equal to AUDIO_FIFO_DEPTH minus fifo_threshold[7:0].

Therefore, the fifo_threshold[7:0] is the medium number of samples that should be available in the audio FIFO across the DMA operation.

- Address Offset: 0x3603
- Size: 8 bits
- Value after Reset: 0x04
- Access: Read/Write

Address: 12_0000h base + 3603h offset = 12_3603h

Bit	7	6	5	4	3	2	1	0
Read Write	fifo_threshold[7]							
Reset	0	0	0	1	0	0	0	0

HDMI_AHB_DMA_THRSLD field descriptions

Field	Description
fifo_threshold[7]	FIFO medium threshold occupation value

33.5.252 Audio DMA Start Address Register 0 (HDMI_AHB_DMA_STRADDR0)

These registers define the initial_addr[31:0] used to initiate the DMA burst read transactions upon data_buffer_ready configuration.

- Address Offset: 0x3604 to 0x3607
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3604h offset = 12_3604h

Bit	7	6	5	4	3	2	1	0
Read Write	initial_addr[7]							
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_STRADDR0 field descriptions

Field	Description
initial_addr[7]	Defines init_addr[7:0] for bits 7-0 to initiate DMA burst transactions

33.5.253 Audio DMA Start Address Register 1 (HDMI_AHB_DMA_STRADDR1)

Address: 12_0000h base + 3605h offset = 12_3605h

Bit	7	6	5	4	3	2	1	0
Read Write	initial_addr[15]							
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_STRADDR1 field descriptions

Field	Description
initial_addr[15]	Defines init_addr[15:8] for bits 7-0 to initiate DMA burst transactions

33.5.254 Audio DMA Start Address Register 2 (HDMI_AHB_DMA_STRADDR2)

Address: 12_0000h base + 3606h offset = 12_3606h

Bit	7	6	5	4	3	2	1	0
Read Write	initial_addr[23]							
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_STRADDR2 field descriptions

Field	Description
initial_addr[23]	Defines init_addr[23:16] for bits 7-0 to initiate DMA burst transactions

33.5.255 Audio DMA Start Address Register 3 (HDMI_AHB_DMA_STRADDR3)

Address: 12_0000h base + 3607h offset = 12_3607h

Bit	7	6	5	4	3	2	1	0
Read Write	initial_addr[31]							
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_STRADDR3 field descriptions

Field	Description
initial_addr[31]	Defines init_addr[31:24] for bits 7-0 to initiate DMA burst transactions

33.5.256 Audio DMA Stop Address Register 0 (HDMI_AHB_DMA_STPADDR0)

This registers define the final_addr[31:0] used as the final point to the DMA burst read transactions.

Upon data_buffer_ready configuration, the DMA engine starts requesting burst reads from the external system memory. Each burst read can have a maximum theoretical length of 1024 words (due to the AMBA AHB specification restriction). As an example, if the first burst transaction of the AHB audio DMA has a length of 16, then the second burst starts at address ohaddr[31:0] = initial_addr[31:0] + 16 and has a length of MBURSTLENGTH[10:0] = AUDIO_FIFO_DEPTH - fifo_threshold[7:0].

The DMA engine is responsible for incrementing the burst starting address and defining its corresponding burst length to reach the final_addr[31:0] address. The last burst request issued by the DMA engine takes into account that it should only request data until the final_addr[31:0] address (included) and for that should calculate the correct burst length.

After reaching the final_addr[31:0] address, the done interrupt is active to signal completion of DMA operation.

- Address Offset: 0x3608 to 0x360B
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3608h offset = 12_3608h

Bit	7	6	5	4	3	2	1	0
Read Write	final_addr[7]							
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_STPADDR0 field descriptions

Field	Description
final_addr[7]	Defines final_addr[7:0] for bits 7-0 to initiate DMA burst transactions

33.5.257 Audio DMA Stop Address Register 1 (HDMI_AHB_DMA_STPADDR1)

Address: 12_0000h base + 3609h offset = 12_3609h

Bit	7	6	5	4	3	2	1	0
Read Write	final_addr[15]							
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_STPADDR1 field descriptions

Field	Description
final_addr[15]	Defines final_addr[15:8] for bits 7-0 to initiate DMA burst transactions

33.5.258 Audio DMA Stop Address Register 2 (HDMI_AHB_DMA_STPADDR2)

Address: 12_0000h base + 360Ah offset = 12_360Ah

Bit	7	6	5	4	3	2	1	0
Read Write	final_addr[23]							
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_STPADDR2 field descriptions

Field	Description
final_addr[23]	Defines final_addr[23:16] for bits 7-0 to initiate DMA burst transactions

33.5.259 Audio DMA Stop Address Register 3 (HDMI_AHB_DMA_STPADDR3)

Address: 12_0000h base + 360Bh offset = 12_360Bh

Bit	7	6	5	4	3	2	1	0
Read Write	final_addr[31]							
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_STPADDR3 field descriptions

Field	Description
final_addr[31]	Defines final_addr[31:24] for bits 7-0 to initiate DMA burst transactions

33.5.260 Audio DMA Burst Start Address Register 0 (HDMI_AHB_DMA_BSTADDR0)

This read-only register composes the start address of the current burst operation. As an example, if the first burst transaction of the AHB audio DMA as a length of 16, then the second burst should start at address ohaddr[31:0] = initial_addr[31:0] + 16. While this burst is being executed, burst_start_addr[31:0] = haddr[31:0] = initial_addr[31:0] + 16.

- Address Offset: 0x360C to 0x360F
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 360Ch offset = 12_360Ch

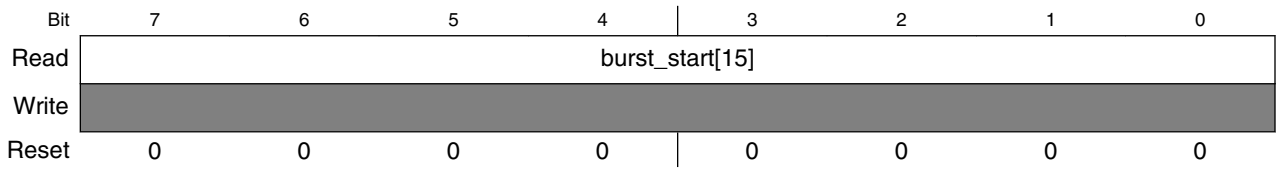
Bit	7	6	5	4	3	2	1	0
Read	burst_start[7]							
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_BSTADDR0 field descriptions

Field	Description
burst_start[7]	Start address for the current burst operation

33.5.261 Audio DMA Burst Start Address Register 1 (HDMI_AHB_DMA_BSTADDR1)

Address: 12_0000h base + 360Dh offset = 12_360Dh

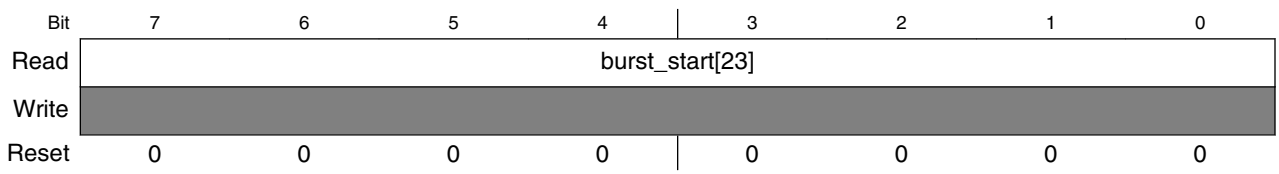


HDMI_AHB_DMA_BSTADDR1 field descriptions

Field	Description
burst_start[15]	Start address for the current burst operation

33.5.262 Audio DMA Burst Start Address Register 2 (HDMI_AHB_DMA_BSTADDR2)

Address: 12_0000h base + 360Eh offset = 12_360Eh

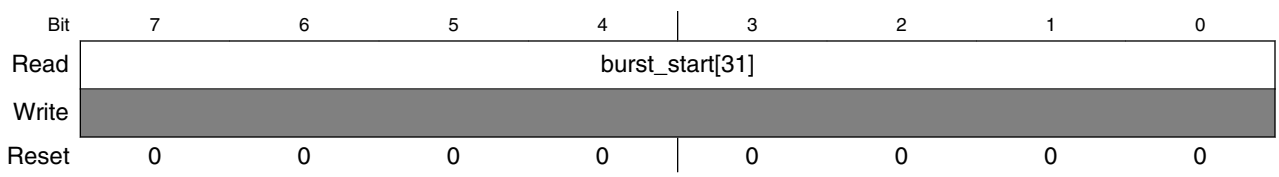


HDMI_AHB_DMA_BSTADDR2 field descriptions

Field	Description
burst_start[23]	Start address for the current burst operation

33.5.263 Audio DMA Burst Start Address Register 3 (HDMI_AHB_DMA_BSTADDR3)

Address: 12_0000h base + 360Fh offset = 12_360Fh



HDMI_AHB_DMA_BSTADDR3 field descriptions

Field	Description
burst_start[31]	Start address for the current burst operation

33.5.264 Audio DMA Burst Length Register 0 (HDMI_AHB_DMA_MBLENGTH0)

These registers hold the length of the current burst operation. As an example, if the first burst transaction of the AHB audio DMA is a length of 8, then the second burst should start at address ohaddr[31:0] = initial_addr[31:0] + 8. It will also have length MBURSTLENGTH[10:0] = AUDIO_FIFO_DEPTH - fifo_threshold[7:0] while this burst is being executed, MBURSTLENGTH[10:0] = AUDIO_FIFO_DEPTH - fifo_threshold[7:0].

- Address Offset: 0x3610 to 0x3611
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 3610h offset = 12_3610h

Bit	7	6	5	4	3	2	1	0
Read	MBURSTLENGTH7							
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_MBLENGTH0 field descriptions

Field	Description
MBURSTLENGTH7	Requested burst length

33.5.265 Audio DMA Burst Length Register 1 (HDMI_AHB_DMA_MBLENGTH1)

Address: 12_0000h base + 3611h offset = 12_3611h

Bit	7	6	5	4
Read	Reserved			
Write				
Reset	0	0	0	0

Bit	3	2	1	0
Read	Reserved	MBURSTLENGTH10	MBURSTLENGTH9	MBURSTLENGTH8
Write				
Reset	0	0	0	0

HDMI_AHB_DMA_MBLENGTH1 field descriptions

Field	Description
7–3 -	This field is reserved. Reserved
2 MBURSTLENGTH10	Requested burst length
1 MBURSTLENGTH9	Requested burst length
0 MBURSTLENGTH8	Requested burst length

33.5.266 Audio DMA Interrupt Status Register (HDMI_AHB_DMA_STAT)

This register contains the status bits of the following interrupts:

- Address Offset: 0x3612
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 3612h offset = 12_3612h

Bit	7	6	5	4
Read	statdone	statretrysplit	statlostownership	staterror
Write				
Reset	0	0	0	0

Bit	3	2	1	0
Read	Reserved	statthrfifoempty	statfifofull	statfifoempty
Write				
Reset	0	0	0	0

HDMI_AHB_DMA_STAT field descriptions

Field	Description
7 statdone	Status of DMA end of operation interrupt. Active when DMA engine reaches final_addr[15:0] or when stop DMA operation is activated.
6 statretrysplit	Status of retry/split interrupt. Active when AHB master receives a RETRY or SPLIT response from slave.
5 statlostownership	Status of master lost ownership when in burst transfer. Active when AHB master loses BUS ownership within the course of a burst transfer.
4 staterror	Status of error interrupt. Active when slave indicates error through the isresp[1:0].
3 -	This field is reserved. Reserved
2 statthrfifoempty	Status of audio FIFO empty when audio FIFO has less than four samples.
1 statfifofull	Status of audio FIFO full interrupt.
0 statfifoempty	Status of audio FIFO empty interrupt.

33.5.267 Audio DMA Interrupt Register (HDMI_AHB_DMA_INT)

This register contains the interrupt bits of the following interrupts:

- Address Offset: 0x3613
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 3613h offset = 12_3613h

Bit	7	6	5	4
Read	intdone	intretrysplit	intlostownership	interror
Write				
Reset	0	0	0	0

Bit	3	2	1	0
Read	Reserved	intthrfifoempty	intfifofull	intfifoempty
Write				
Reset	0	0	0	0

HDMI_AHB_DMA_INT field descriptions

Field	Description
7 intdone	DMA end of operation interrupt. Active when DMA engine reaches final_addr[15:0] or when stop DMA operation is activated.
6 intretrysplit	Retry/split interrupt. Active when AHB master receives a RETRY or SPLIT response from slave.
5 intlostownership	Master lost ownership interrupt when in burst transfer. Active when AHB master loses BUS ownership within the course of a burst transfer.
4 interror	Error interrupt. Active when slave indicates error through the isresp[1:0].
3 -	This field is reserved. Reserved
2 intthrfifoempty	Audio FIFO empty interrupt when audio FIFO has less than four samples.
1 intfifofull	Audio FIFO full interrupt.
0 intfifoempty	Audio FIFO empty interrupt.

33.5.268 Audio DMA Mask Interrupt Register (HDMI_AHB_DMA_MASK)

Mask for each of the interrupts present in the AHB audio DMA module. For usage information, see Audio DMA Interrupt Register (HDMI_AHB_DMA_INT) ."

- Address Offset: 0x3614
- Size: 8 bits per register
- Value after Reset: 0xF7
- Access: Read/Write

Address: 12_0000h base + 3614h offset = 12_3614h

Bit	7	6	5	4
Read Write	done_mask	retrysplit_mask	lostownership_mask	error_mask
Reset	0	0	0	1

Bit	3	2	1	0
Read Write	Reserved	fifo_thrempty_mask	fifo_full_mask	fifo_empty_mask
Reset	0	0	0	1

HDMI_AHB_DMA_MASK field descriptions

Field	Description
7 done_mask	DMA end of operation interrupt mask. Active when DMA engine reaches final_addr[15:0] or when stop DMA operation is activated.

Table continues on the next page...

HDMI_AHB_DMA_MASK field descriptions (continued)

Field	Description
6 retrysplit_mask	Retry/split interrupt mask. Active when AHB master receives a RETRY or SPLIT response from slave.
5 lostownership_ mask	Master lost ownership interrupt mask when in burst transfer. Active when AHB master loses BUS ownership within the course of a burst transfer.
4 error_mask	Error interrupt mask. Active when slave indicates error through the isresp[1:0].
3 -	This field is reserved. Reserved
2 fifo_thrempty_ mask	Audio FIFO empty interrupt mask when audio FIFO has less than four samples.
1 fifo_full_mask	Audio FIFO full interrupt mask.
0 fifo_empty_mask	Audio FIFO empty interrupt mask.

33.5.269 Audio DMA Polarity Interrupt Register (HDMI_AHB_DMA_POL)

Polarity for each of the interrupts present in the AHB audio DMA module. For usage information, see Audio DMA Interrupt Register (HDMI_AHB_DMA_INT) ."

- Address Offset: 0x3615
- Size: 8 bits per register
- Value after Reset: 0xF7
- Access: Read/Write

Address: 12_0000h base + 3615h offset = 12_3615h

Bit	7	6	5	4
Read Write	done_polarity	retrysplit_polarity	lostownership_polarity	error_polarity
Reset	0	0	0	1

Bit	3	2	1	0
Read Write	Reserved	fifo_thrfifoempty_ polarity	fifo_full_polarity	fifo_empty_polarity
Reset	0	0	0	1

HDMI_AHB_DMA_POL field descriptions

Field	Description
7 done_polarity	DMA end of operation interrupt mask. Active when DMA engine reaches final_addr[15:0] or when stop DMA operation is activated.

Table continues on the next page...

HDMI_AHB_DMA_POL field descriptions (continued)

Field	Description
6 retrysplit_polarity	Retry/split interrupt mask. Active when AHB master receives a RETRY or SPLIT response from slave.
5 lostownership_ polarity	Master lost ownership interrupt mask when in burst transfer. Active when AHB master loses BUS ownership within the course of a burst transfer.
4 error_polarity	Error interrupt mask. Active when slave indicates error through the isresp[1:0].
3 -	This field is reserved. Reserved
2 fifo_thrfifoempty_ polarity	Audio FIFO empty interrupt mask when audio FIFO has less than four samples.
1 fifo_full_polarity	Audio FIFO full interrupt mask.
0 fifo_empty_ polarity	Audio FIFO empty interrupt mask.

33.5.270 Audio DMA Channel Enable Configuration Register 1 (HDMI_AHB_DMA_CONF1)

- Address Offset: 0x3616
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 3616h offset = 12_3616h

Bit	7	6	5	4	3	2	1	0
Read Write	CH_IN_EN7	CH_IN_EN6	CH_IN_EN5	CH_IN_EN4	CH_IN_EN3	CH_IN_EN2	CH_IN_EN1	CH_IN_EN0
Reset	0	0	0	0	0	0	0	0

HDMI_AHB_DMA_CONF1 field descriptions

Field	Description
7 CH_IN_EN7	Channel 7 enable bit 1 Channel enabled 0 Channel disabled
6 CH_IN_EN6	Channel 6 enable bit 1 Channel enabled 0 Channel disabled

Table continues on the next page...

HDMI_AHB_DMA_CONF1 field descriptions (continued)

Field	Description
5 CH_IN_EN5	Channel 5 enable bit 1 Channel enabled 0 Channel disabled
4 CH_IN_EN4	Channel 4 enable bit 1 Channel enabled 0 Channel disabled
3 CH_IN_EN3	Channel 3 enable bit 1 Channel enabled 0 Channel disabled
2 CH_IN_EN2	Channel 2 enable bit 1 Channel enabled 0 Channel disabled
1 CH_IN_EN1	Channel 1 is always enabled.
0 CH_IN_EN0	Channel 0 is always enabled.

33.5.271 Audio DMA Buffer Interrupt Status Register (HDMI_AHB_DMA_BUFFSTAT)

- Address Offset: 0x3617
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 3617h offset = 12_3617h

7–2 -	This field is reserved. Reserved
1 int_buff_full	Buffer full flag polarity
0 int_buff_empty	Buffer empty flag polarity

33.5.275 Main Controller Synchronous Clock Domain Disable Register (HDMI_MC_CLKDIS)

Main controller synchronous disable control per clock domain. Upon release of synchronous disable the corresponding sw reset NRZ request signal, to that domain, is toggled asking to the output for a synchronized active low reset to be generated to that domain.

- Address Offset: 0x4001
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 4001h offset = 12_4001h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved	Reserved	cecclk_ disable	cscclk_ disable	audclk_ disable	prepclk_ disable	tmdsclk_ disable	pixelclk_ disable
Reset	0	0	0	0	0	0	0	0

HDMI_MC_CLKDIS field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 hdcpclk_disable	This field is reserved. Reserved
5 cecclk_disable	CEC Engine clock synchronous disable signal.
4 cscclk_disable	Color Space Converter clock synchronous disable signal.
3 audclk_disable	Audio Sampler clock synchronous disable signal.
2 prepclk_disable	Pixel Repetition clock synchronous disable signal.

Table continues on the next page...

HDMI_MC_CLKDIS field descriptions (continued)

Field	Description
1 tmdsclk_disable	TMDS clock synchronous disable signal.
0 pixelclk_disable	Pixel clock synchronous disable signal.

33.5.276 Main Controller Software Reset Register (HDMI_MC_SWRSTZREQ)

Main controller software reset request per clock domain. Writing zero to a bit of this register results in an NRZ signal toggle at sfrclk rate to an output signal that indicates a software reset request. This toggle must be used to generate a synchronized reset to de corresponding domain, with at least 1 clock cycle. Register defaults back to 0xFF.

- Address Offset: 0x4002
- Size: 8 bits
- Value after Reset: 0xFF
- Access: Read/Write

Address: 12_0000h base + 4002h offset = 12_4002h

Bit	7	6	5	4
Read Write	Reserved	cecswrst_req	Reserved	
Reset	1	1	1	1

Bit	3	2	1	0
Read Write	Reserved	prepswrst_req	tmdsswrst_req	pixelswrst_req
Reset	1	1	1	1

HDMI_MC_SWRSTZREQ field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 cecswrst_req	CEC software reset request. Defaults back to 1b after reset request.
5–3 -	This field is reserved. Reserved
2 prepswrst_req	Pixel Repetition clock synchronous disable signal.
1 tmdsswrst_req	TMDS software reset request. Defaults back to 1b after reset request.
0 pixelswrst_req	Pixel software reset request. Defaults back to 1b after reset request.

33.5.277 Main Controller Feed Through Control Register (HDMI_MC_FLOWCTRL)

- Address Offset: 0x4004
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 4004h offset = 12_4004h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved							Feed_ through_off
Reset	0	0	0	0	0	0	0	0

HDMI_MC_FLOWCTRL field descriptions

Field	Description
7–1 -	This field is reserved. Reserved
0 Feed_through_off	Video path Feed Through enable bit: 1 Color Space Converter is in the video data path. 0 Color Space Converter is bypassed (not in the video data path).

33.5.278 Main Controller PHY Reset Register (HDMI_MC_PHYRSTZ)

- Address Offset: 0x4005
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 4005h offset = 12_4005h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved							phyrstz
Reset	0	0	0	0	0	0	0	0

HDMI_MC_PHYRSTZ field descriptions

Field	Description
7–1 -	This field is reserved. Reserved
0 phyrstz	HDMI Source PHY active low reset control.

33.5.279 Main Controller Clock Present Register (HDMI_MC_LOCKONCLOCK)

- Address Offset: 0x4006
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12_0000h base + 4006h offset = 12_4006h

Bit	7	6	5	4	3	2	1	0
Read	Reserved	pclk	tclktclk	prepclk	Reserved			cecclk
Write		w1c	w1c	w1c				w1c
Reset	0	0	0	0	0	0	0	0

HDMI_MC_LOCKONCLOCK field descriptions

Field	Description
7 -	This field is reserved. Reserved.
6 pclk	Pixel clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.
5 tclktclk	TMDS clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position
4 prepclk	Pixel repetition clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.
3–1 -	This field is reserved. Reserved.
0 cecclk	CEC clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.

33.5.280 Main Controller HEAC PHY Reset Register (HDMI_MC_HEACPHY_RST)

- Address Offset: 0x4007
- Size: 8 bits
- Value after Reset: N/A
- Access: Read/Write

Address: 12_0000h base + 4007h offset = 12_4007h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved							heacphyrst
Reset	0	0	0	0	0	0	0	0

HDMI_MC_HEACPHY_RST field descriptions

Field	Description
7–1 -	This field is reserved. Reserved
0 heacphyrst	HEAC PHY reset (active high)

33.5.281 Color Space Converter Interpolation and Decimation Configuration Register (HDMI_CSC_CFG)

Color Space Conversion configuration register. Configures YCC422 to YCC444 interpolation mode and YCC444 to YCC422 decimation mode.

- Address Offset: 0x4100
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 4100h offset = 12_4100h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved		INTMODE		Reserved		DECMODE	
Reset	0	0	0	0	0	0	0	0

HDMI_CSC_CFG field descriptions

Field	Description
7–6 -	This field is reserved. Reserved
5–4 INTMODE	Chroma interpolation configuration: 00 interpolation disabled 01 $H_u(z) = 1 + z^{-1}$ 10 $H_u(z)=1/2 + Z^{-1} +1/2\ z^{-2}$ 11 interpolation disabled.
3–2 -	This field is reserved. Reserved

33.5.282 Color Space Converter Scale and Deep Color Configuration Register (HDMI_CSC_SCALE)

- Address Offset: 0x4101
- Size: 8 bits
- Value after Reset: 0x01
- Access: Read/Write

$$\begin{bmatrix} G \\ R \\ B \end{bmatrix} = 2^{\text{csc scale} - 12} \times \begin{bmatrix} A_1 & A_2 & A_3 \\ B_1 & B_2 & B_3 \\ C_1 & C_2 & C_3 \end{bmatrix} + 2^{\text{csc scale}} \times \begin{bmatrix} A_4 \\ B_4 \\ C_4 \end{bmatrix}$$

$$\begin{bmatrix} Y \\ Cb \\ Cr \end{bmatrix} = 2^{\text{cscscale} - 12} \times \begin{bmatrix} A_1 & A_2 & A_3 \\ B_1 & B_2 & B_3 \\ C_1 & C_2 & C_3 \end{bmatrix} + 2^{\text{cscscale}} \times \begin{bmatrix} A_4 \\ B_4 \\ C_4 \end{bmatrix}$$

Figure 33-17. CSC Conversion Functions

Address: 12_0000h base + 4101h offset = 12_4101h

Bit	7	6	5	4	3	2	1	0
Read Write	csc_colorde_pth[3:0]				Reserved		-	
Reset	0	0	0	0	0	0	0	1

HDMI_CSC_SCALE field descriptions

Field	Description
7–4 csc_colorde_pth[3:0]	Color space converter color depth configuration: Other: Reserved. 0000 24 bit per pixel video (8 bit per component). 0100 24 bit per pixel video (8 bit per component). 0101 30 bit per pixel video (10 bit per component). 0110 36 bit per pixel video (12 bit per component). 0111 48 bit per pixel video (16 bit per component).
3–2 -	This field is reserved. Reserved
-	Defines the cscscale[1:0] scale factor to apply to all coefficients in Color Space Conversion. This scale factor is expressed in the number of left shifts to apply to each of the coefficients, ranging from 0 to 2.

33.5.283 CSC_COEF_A1_MSB (HDMI_CSC_COEF_A1_MSB)

Color Space Conversion A1 coefficient.

- Address Offset: 0x4102
- Size: 8 bits
- Value after Reset: 0x20
- Access: Read/Write

Address: 12_0000h base + 4102h offset = 12_4102h

CSC_COEFC4_LSB	Color Space Conversion C4 LSB coefficient.

33.5.307 CEC_CTRL (HDMI_CEC_CTRL)

CEC registers control the CEC feature that is implemented in HDMI TX. They perform various functions like controlling, monitoring, and buffering data for the transmitter and the receiver.

This register handles the main control of the CEC initiator.

- Address Offset: 0x7D00
- Size: 8 bits
- Value after Reset: 0x02
- Access: Read/Write

Address: 12_0000h base + 7D00h offset = 12_7D00h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved			STANDBY	BC_NACK	FRAME_TYP		SEND
Reset	0	0	0	0	0	0	1	0

HDMI_CEC_CTRL field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
4 STANDBY	Standby bit 0 CEC controller responds the ACK to all messages. 1 CEC controller responds with ACK to all ping messages (only when the EOM is received) and responds with NACK to all other messages, generating wake-up status for selected opcodes. Attention that the NACK will only be posted on the last block of a frame.
3 BC_NACK	Broadcast NACK bit 0 Reset by software to ACK the received broadcast message. 1 Set by software to NACK the received broadcast message. This bit holds till software resets. The broadcasts will be answered with 1'b0. It means the follower reject the message.

Table continues on the next page...

HDMI_CEC_CTRL field descriptions (continued)

Field	Description
2–1 FRAME_TYP	Frame Type bit 00 Signal Free Time = 3-bit periods. Previous attempt to send frame is unsuccessful. 01 Signal Free Time = 5-bit periods. New initiator wants to send a frame. 10 Signal Free Time = 7-bit periods. Present initiator wants to send another frame immediately after its previous frame. (spec CEC 9.1) 11 Illegal value. If software write this value, hardware will set the value to the default 2'b01.
0 SEND	Send bit 0 Reset to 0 by hardware when the CEC transmission is done (no matter successful or failed). It can also work as an indicator checked by software to see whether the transmission is finished. 1 Set by software to trigger CEC sending a frame as an initiator. This bit keeps at 1 while the transmission is going on.

33.5.308 CEC_STAT (HDMI_CEC_STAT)

This register indicates the status of CEC line. All bits are read only. When an event occurs, the corresponding bit will set to 1 for one SFR clock cycle only. Then, the bit automatically resets to 0. No software reset is required. Software can read the "stable" interrupts on IH_CEC_STAT0 register (this register has the same bit arrangement as CEC_STAT register).

- Address Offset: 0x7D01
- Size: 8 bits
- Value after Reset: N/A
- Access: Read

Address: 12_0000h base + 7D01h offset = 12_7D01h

Bit	7	6	5	4	3	2	1	0
Read	Reserved	WAKEUP	ERROR_ FOLL	ERROR_ INIT	ARB_LOST	NACK	EOM	DONE
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_CEC_STAT field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 WAKEUP	Follower received wake-up command (for follower only).
5 ERROR_FOLL	An error is notified by a follower. Abnormal logic data bit error (for follower).

Table continues on the next page...

HDMI_CEC_STAT field descriptions (continued)

Field	Description
4 ERROR_INIT	An error is detected on cec line (for initiator only).
3 ARB_LOST	The initiator losses the CEC line arbitration to a second initiator. (specification CEC 9).
2 NACK	A frame is not acknowledged in a directly addressed message. Or a frame is negatively acknowledged in a broadcast message (for initiator only).
1 EOM	EOM is detected so that the received data is ready in the receiver data buffer (for follower only).
0 DONE	The current transmission is successful (for initiator only).

33.5.309 CEC_MASK (HDMI_CEC_MASK)

This read/write register masks/unmasks the interrupt events. When the bit is set to 1 (masked), the corresponding event will not trigger an interrupt signal at the system interface. When the bit is reset to 0, the interrupt event is unmasked.

- Address Offset: 0x7D02
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7D02h offset = 12_7D02h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved	WAKEUP_ MASK	ERROR_ FOLL_ MASK	ERROR_ INIT_MASK	ARB_ LOST_ MASK	NACK_ MASK	EOM_MASK	DONE_ MASK
Reset	0	0	0	0	0	0	0	0

HDMI_CEC_MASK field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 WAKEUP_MASK	Follower wake-up signal mask
5 ERROR_FOLL_ MASK	An error is notified by a follower. Abnormal logic data bit error (for follower).
4 ERROR_INIT_ MASK	An error is detected on cec line (for initiator only).

Table continues on the next page...

HDMI_CEC_MASK field descriptions (continued)

Field	Description
3 ARB_LOST_ MASK	The initiator losses the CEC line arbitration to a second initiator. (specification CEC 9).
2 NACK_MASK	A frame is not acknowledged in a directly addressed message. Or a frame is negatively acknowledged in a broadcast message (for initiator only).
1 EOM_MASK	EOM is detected so that the received data is ready in the receiver data buffer (for follower only).
0 DONE_MASK	The current transmission is successful (for initiator only).

33.5.310 CEC_POLARITY (HDMI_CEC_POLARITY)

This register is readable and writable, which controls the polarity of the interrupt status register as well as the polarity of the interrupt signals at system interface.

- Address Offset: 0x7D03
- Size: 8 bits
- Value after Reset: 0x7F
- Access: Read/Write

Address: 12_0000h base + 7D03h offset = 12_7D03h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved	WAKEUP_ POL	ERROR_ FOLL_POL	ERROR_ INIT_POL	ARB_ LOST_POL	NACK_POL	EOM_POL	DONE_POL
Reset	0	1	1	1	1	1	1	1

HDMI_CEC_POLARITY field descriptions

Field	Description
7 - Reserved	This field is reserved.
6 WAKEUP_POL	Follower wakeup signal polarity
5 ERROR_FOLL_ POL	CEC line error polarity (for follower only)
4 ERROR_INIT_ POL	CEC line error polarity (for initiator only)
3 ARB_LOST_POL	Initiator Arbitration lost signal polarity
2 NACK_POL	Frame NACK signal polarity

Table continues on the next page...

HDMI_CEC_POLARITY field descriptions (continued)

Field	Description
1 EOM_POL	EOM detect signal polarity (follower only)
0 DONE_POL	Current transmission success or not signal polarity

33.5.311 CEC_INT (HDMI_CEC_INT)

This register is read only. Each bit of the register is output at the system interface. The output signals hold the active interrupt state (high or low) for only one SFR clock cycle. Then the hardware resets the bit to an inactive state. Software can read the "stable" interrupts on the IH_CEC_STAT0 register at address 0x0106 (this register has the same bit arrangement as the CEC_STAT register).

The functional formula for the interrupts is:

CEC_INT = (CEC_MASK == 0b) && (CEC_STATUS == CEC_POLARITY)

- Address Offset: 0x7D04
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 7D04h offset = 12_7D04h

Bit	7	6	5	4
Read	Reserved	WAKEUP_INT	ERROR_FOLL_INT	ERROR_INIT_INT
Write				
Reset	0	0	0	0

Bit	3	2	1	0
Read	ARB_LOST_INT	NACK_INT	EOM_INT	DONE_INT
Write				
Reset	0	0	0	0

HDMI_CEC_INT field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 WAKEUP_INT	Follower wakeup signal polarity

Table continues on the next page...

HDMI_CEC_INT field descriptions (continued)

Field	Description
5 ERROR_FOLL_INT	Follower wakeup interrupt
4 ERROR_INIT_INT	CEC line error interrupt (for follower only)
3 ARB_LOST_INT	CEC line error interrupt (for initiator only)
2 NACK_INT	Initiator Arbitration lost interrupt
1 EOM_INT	Frame NACK interrupt
0 DONE_INT	EOM detect interrupt (for follower only)

33.5.312 CEC_ADDR_L (HDMI_CEC_ADDR_L)

CEC_ADDR_L and CEC_ADDR_H registers indicate the logical address(es) allocated to the CEC device. The logical address mappings are shown in CEC_ADDR_L (HDMI_CEC_ADDR_L) and CEC_ADDR_H (HDMI_CEC_ADDR_H) . This register is written by software when the logical allocation is finished. Bit value 1 means the corresponding logical address is allocated to this device. Bit value 0 means the corresponding logical address is not allocated to this device.

- Address Offset: 0x7D05
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7D05h offset = 12_7D05h

Bit	7	6	5	4
Read Write	CEC_ADDR_L7	CEC_ADDR_L6	CEC_ADDR_L5	CEC_ADDR_L4
Reset	0	0	0	0

Bit	3	2	1	0
Read Write	CEC_ADDR_L3	CEC_ADDR_L2	CEC_ADDR_L1	CEC_ADDR_L0
Reset	0	0	0	0

HDMI_CEC_ADDR_L field descriptions

Field	Description
7 CEC_ADDR_L7	Logical address 7 - Tuner 3
6 CEC_ADDR_L6	Logical address 6 - Tuner 2
5 CEC_ADDR_L5	Logical address 5 - Audio System
4 CEC_ADDR_L4	Logical address 4 - Playback Device 1
3 CEC_ADDR_L3	Logical address 3 - Tuner 1
2 CEC_ADDR_L2	Logical address 2 - Recording Device 2
1 CEC_ADDR_L1	Logical address 1 - Recording Device 1
0 CEC_ADDR_L0	Logical address 0 - Device TV

33.5.313 CEC_ADDR_H (HDMI_CEC_ADDR_H)

CEC_ADDR_L and CEC_ADDR_H registers indicate the logical address(es) allocated to the CEC device. The logical address mappings are shown in CEC_ADDR_L (HDMI_CEC_ADDR_L) and CEC_ADDR_H (HDMI_CEC_ADDR_H) . This register is written by software when the logical allocation is finished. Bit value 1 means the corresponding logical address is allocated to this device. Bit value 0 means the corresponding logical address is not allocated to this device.

- Address Offset: 0x7D06
- Size: 8 bits
- Value after Reset: 0x80
- Access: Read/Write

Address: 12_0000h base + 7D06h offset = 12_7D06h

Bit	7	6	5	4
Read Write	CEC_ADDR_H7	CEC_ADDR_H6	CEC_ADDR_H5	CEC_ADDR_H4
Reset	1	0	0	0

Bit	3	2	1	0
Read Write	CEC_ADDR_H3	CCEC_ADDR_H2	CEC_ADDR_H1	CEC_ADDR_H0
Reset	0	0	0	0

HDMI_CEC_ADDR_H field descriptions

Field	Description
7 CEC_ADDR_H7	Logical address 15 - Unregistered (as initiator address), Broadcast (as destination address)
6 CEC_ADDR_H6	Logical address 14 - Free use
5 CEC_ADDR_H5	Logical address 13 - Reserved
4 CEC_ADDR_H4	Logical address 12 - Reserved
3 CEC_ADDR_H3	Logical address 11 - Playback Device 3
2 CCEC_ADDR_H2	Logical address 10 - Tuner 4
1 CEC_ADDR_H1	Logical address 9 - Playback Device 3
0 CEC_ADDR_H0	Logical address 8 - Playback Device 2

33.5.314 CEC_TX_CNT (HDMI_CEC_TX_CNT)

This register indicates the size of the frame in bytes (including header and data blocks), which are available in the transmitter data buffer.

When the value is zero, the CEC controller ignores the send command triggered by software. When the transmission is done (no matter success or not), the current value is held until it is overwritten by software.

- Address Offset: 0x7D07
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7D07h offset = 12_7D07h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				CEC_TX_CNT			
Reset	0	0	0	0	0	0	0	0

HDMI_CEC_TX_CNT field descriptions

Field	Description
7–5 -	This field is reserved. Reserved

Table continues on the next page...

HDMI_CEC_TX_CNT field descriptions (continued)

Field	Description
CEC_TX_CNT	CEC Transmitter Counter register: Value after Reset: 5'b00000 0 No data needs to be transmitted. 1 Frame size is 1 byte. 16 Frame size is 16 byte.

33.5.315 CEC_RX_CNT (HDMI_CEC_RX_CNT)

This register indicates the size of the frame in bytes (including header and data blocks), which are available in the receiver data buffer.

Only after the whole receiving process is finished successfully, the counter is refreshed to the value which indicates the total number of data bytes in the Receiver Data Register.

- Address Offset: 0x7d08
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 7D08h offset = 12_7D08h

Bit	7	6	5	4	3	2	1	0
Read	-			CEC_RX_CNT				
Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI_CEC_RX_CNT field descriptions

Field	Description
7–5 -	
CEC_RX_CNT	CEC Receiver Counter register. Value after Reset: 5‘b00000 0 No data received 1 1-byte data is received. 16 16-byte data is received.

33.5.316 CEC_TX_DATA (HDMI_CEC_TX_DATA*n*)

These registers (8 bit each) are the buffers used for storing the data waiting for transmission(including header and data blocks).

- Address Offset: 0x7D10 .. 0x7D1F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 7D10h offset + (1d × i), where i=0d to 15d

Bit	7	6	5	4	3	2	1	0
Read Write	CEC_TX_DATA							
Reset	0	0	0	0	0	0	0	0

HDMI_CEC_TX_DATA*n* field descriptions

Field	Description
CEC_TX_DATA	Header block in CEC_TX_DATA0 Data blockn in CEC_TX_DATAn

33.5.317 CEC_RX_DATA (HDMI_CEC_RX_DATA*n*)

These registers (8 bit each) are the buffers used for storing the received data (including header and data blocks).

- Address Offset: 0x7D20 .. 0x7D2F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 7D20h offset + (1d × i), where i=0d to 15d

Bit	7	6	5	4	3	2	1	0
Read	CEC_RX_DATA							
Write								
Reset	0	0	0	0	0	0	0	0

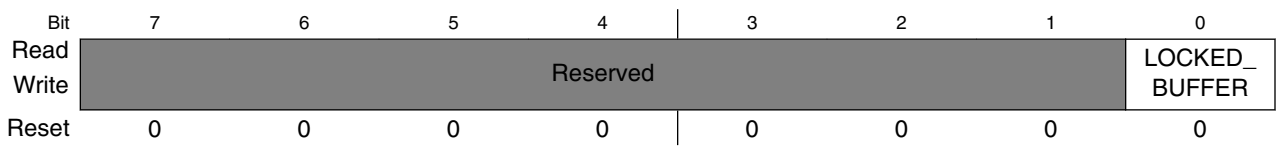
HDMI_CEC_RX_DATA*n* field descriptions

Field	Description
CEC_RX_DATA	Header block in CEC_RX_DATA0 Data blockn in CEC_RX_DATAn

33.5.318 CEC_LOCK (HDMI_CEC_LOCK)

- Address Offset: 0x7D30
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7D30h offset = 12_7D30h



HDMI_CEC_LOCK field descriptions

Field	Description
7–1 -	This field is reserved. Reserved
0 LOCKED_ BUFFER	When a frame is received, this bit would be active. The CEC controller answers to all the messages with NACK until the CPU writes it to '0'.

33.5.319 CEC_WKUPCTRL (HDMI_CEC_WKUPCTRL)

- Address Offset: 0x7D31
- Size: 8 bits
- Value after Reset: 0xFF
- Access: Read/Write

After receiving a message in the CEC_RX_DATA1 (OPCODE) registers, the CEC engine verifies the message opcode[7:0] against one of the previously defined values to generate the wake-up status:

Wakeupstatus is 1 when:

received opcode is 0x04 and opcode0x04en is 1 or received opcode is 0x0D and opcode0x0Den is 1 or received opcode is 0x41 and opcode0x41en is 1 or received opcode is 0x42 and opcode0x42en is 1 or received opcode is 0x44 and opcode0x44en is 1 or received opcode is 0x70 and opcode0x70en is 1 or received opcode is 0x82 and opcode0x82en is 1 or received opcode is 0x86 and opcode0x86en is 1

Wakeupstatus is 0 when none of the previous conditions are true.

This formula means that the wake-up status (on CEC_STAT[6] register) is only '1' if the opcode[7:0] received is equal to one of the defined values and the corresponding enable bit of that defined value is set to '1'.

Address: 12_0000h base + 7D31h offset = 12_7D31h

Bit	7	6	5	4
Read Write	OPCODE0x86en	OPCODE0x82en	OPCODE0x70en	OPCODE0x44en
Reset	1	1	1	1

Bit	3	2	1	0
Read Write	OPCODE0x42en	OPCODE0x41en	OPCODE0x0Den	OPCODE0x04en
Reset	1	1	1	1

HDMI_CEC_WKUPCTRL field descriptions

Field	Description
7 OPCODE0x86en	OPCODE 0x86 wake up enable
6 OPCODE0x82en	OPCODE 0x82 wake up enable
5 OPCODE0x70en	OPCODE 0x70 wake up enable
4 OPCODE0x44en	OPCODE 0x44 wake up enable
3 OPCODE0x42en	OPCODE 0x42 wake up enable
2 OPCODE0x41en	OPCODE 0x41 wake up enable
1 OPCODE0x0Den	OPCODE 0x0D wake up enable
0 OPCODE0x04en	OPCODE 0x04 wake up enable

33.5.320 I2CM_SLAVE (HDMI_I2CM_SLAVE)

I2C Master Registers (E-DDC) registers are responsible for the Master's coordination with the Slave, by coordinating the Slave address, data identification, transaction status, acknowledgement, and reset functions.

- Address Offset: 0x7E00
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7E00h offset = 12_7E00h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved	slaveaddr[6:0]						
Reset	0	0	0	0	0	0	0	0

HDMI_I2CM_SLAVE field descriptions

Field	Description
7 - Reserved	This field is reserved.
slaveaddr[6:0]	Slave address to be sent during read and write normal operations.

33.5.321 I2CM_ADDRESS (HDMI_I2CM_ADDRESS)

- Address Offset: 0x7E01
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7E01h offset = 12_7E01h

Bit	7	6	5	4	3	2	1	0
Read Write	address[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_I2CM_ADDRESS field descriptions

Field	Description
address[7:0]	Register address for read and write operations.

33.5.322 I2CM_DATAO (HDMI_I2CM_DATAO)

- Address Offset: 0x7E02
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7E02h offset = 12_7E02h

Bit	7	6	5	4	3	2	1	0
Read Write	datao[7:0]							
Reset	0	0	0	0	0	0	0	0

HDMI_I2CM_DATAO field descriptions

Field	Description
datao[7:0]	Data to be written on register pointed by address[7:0].

33.5.323 I2CM_DATAI (HDMI_I2CM_DATAI)

- Address Offset: 0x7E03
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12_0000h base + 7E03h offset = 12_7E03h

Bit	7	6	5	4	3	2	1	0
Read	datai[7:0]							
Write								
Reset	0	0	0	0	0	0	0	0

HDMI_I2CM_DATAI field descriptions

Field	Description
datai[7:0]	Data read from register pointed by address[7:0].

33.5.324 I2CM_OPERATION (HDMI_I2CM_OPERATION)

Read and write operation request. This register can only be written, reading this register will always result in 00h. Writing 1'b1 simultaneously to rd, rd_ext and wr requests is considered as a read (rd) request.

- Address Offset: 0x7E04
- Size: 8 bits
- Value after Reset: 0x00
- Access: Write

Address: 12_0000h base + 7E04h offset = 12_7E04h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				Reserved			
Write				wr			rd_ext	rd
Reset	0	0	0	0	0	0	0	0

HDMI_I2CM_OPERATION field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
4 wr	Write operation request.
3–2 -	This field is reserved. Reserved
1 rd_ext	After writing 1'b1 to rd_ext bit a extended data read operation is started (E- DDC read operation).
0 rd	Read operation request.

33.5.325 I2CM_INT (HDMI_I2CM_INT)

This register contains and configures I2C master done interrupt.

- Address Offset: 0x7E05
- Size: 8 bits
- Value after Reset: 0x08
- Access: Read/Write

Address: 12_0000h base + 7E05h offset = 12_7E05h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				done_pol	done_mask	done_ interrupt	done_status
Reset	0	0	0	0	1	0	0	0

HDMI_I2CM_INT field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
3 done_pol	Done interrupt polarity configuration.
2 done_mask	Done interrupt mask signal.
1 done_interrupt	Operation done interrupt bit. Only lasts for 1 SFR clock cycle and is auto cleaned after it. {done_interrupt = (done_mask==0b) && (done_status==done_pol)}.
0 done_status	Operation done status bit. Marks the end of a rd or write operation.

33.5.326 I2CM_CTLINT (HDMI_I2CM_CTLINT)

This register contains and configures I2C master arbitration error and not acknowledge error interrupt.

- Address Offset: 0x7E06
- Size: 8 bits
- Value after Reset: 0x88
- Access: Read/Write

Address: 12_0000h base + 7E06h offset = 12_7E06h

Bit	7	6	5	4
Read Write	nack_pol	nack_mask	nack_interrupt	nack_status
Reset	1	0	0	0

Bit	3	2	1	0
Read Write	arbitration_pol	arbitration_mask	arbitration_interrupt	arbitration_status
Reset	1	0	0	0

HDMI_I2CM_CTLINT field descriptions

Field	Description
7 nack_pol	Not acknowledge error interrupt polarity configuration.
6 nack_mask	Not acknowledge error interrupt mask signal.
5 nack_interrupt	Not acknowledge error interrupt bit. Only lasts for 1 SFR clock cycle and is auto cleaned after it. {nack_interrupt = (nack_mask==0b) && (nack_status==nack_pol)}.
4 nack_status	Not acknowledge error status bit. Error on I2C not acknowledge.
3 arbitration_pol	Arbitration error interrupt polarity configuration.
2 arbitration_mask	Arbitration error interrupt mask signal.
1 arbitration_ interrupt	Arbitration error interrupt bit. Only lasts for 1 SFR clock cycle and is auto cleaned after it. {arbitration_interrupt = (arbitration_mask==0b) && (arbitration_status==arbitration_pol)}.
0 arbitration_status	Arbitration error status bit. Error on master I2C protocol arbitration.

33.5.327 I2CM_DIV (HDMI_I2CM_DIV)

This register configures the division relation between master and scl clock.

- Address Offset: 0x7E07
- Size: 8 bits
- Value after Reset: 0x0B
- Access: Read/Write

Address: 12_0000h base + 7E07h offset = 12_7E07h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				fast_std_ mode	Reserved		
Reset	0	0	0	0	1	0	1	1

HDMI_I2CM_DIV field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
3 fast_std_mode	Sets the I2C Master to work in Fast Mode or Standard Mode: 1 Fast Mode 0 Standard Mode
-	This field is reserved. Reserved

33.5.328 I2CM_SEGADDR (HDMI_I2CM_SEGADDR)

This register configures the segment address for extended RD/WR destination.

- Address Offset: 0x7E08
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7E08h offset = 12_7E08h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved	SEGADDR						
Reset	0	0	0	0	0	0	0	0

HDMI_I2CM_SEGADDR field descriptions

Field	Description
7 -	This field is reserved. Reserved
SEGADDR	E-DDC Extended read segment address

33.5.329 I2CM_SOFTRSTZ (HDMI_I2CM_SOFTRSTZ)

This register resets the I2C master.

- Address Offset: 0x7E09
- Size: 8 bits
- Value after Reset: 0x01
- Access: Read/Write

Address: 12_0000h base + 7E09h offset = 12_7E09h

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved							i2c_softrst
Reset	0	0	0	0	0	0	0	1

HDMI_I2CM_SOFTRSTZ field descriptions

Field	Description
7–1 -	This field is reserved. Reserved
0 i2c_softrst	I2C Master Software Reset. Active by writing a zero and auto cleared to one in the following cycle. Value after Reset: 1b

33.5.330 I2CM_SEGPTR (HDMI_I2CM_SEGPTR)

This register configures the segment pointer for extended RD/WR request.

- Address Offset: 0x7E0A
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

The following *CNT registers must be set before any I2C bus transaction can take place to ensure proper I/O timing.

Address: 12_0000h base + 7E0Ah offset = 12_7E0Ah

Bit	7	6	5	4	3	2	1	0
Read Write	I2CM_SEGPTR							
Reset	0	0	0	0	0	0	0	0

HDMI_I2CM_SEGPTR field descriptions

Field	Description
I2CM_SEGPTR	I2CM_SEGPTR is used for EDID reading operations, particularly for the Extended Data Read Operation (See I²C Master Interface Extended Read Mode ") which is used for Enhanced DDC. This is all described in the VESA Enhanced Display Data Channel Standard v1.1 spec. (addresses A0h/A1h pairs and a segment pointer - 60h).

33.5.331 I2CM_SS_SCL_HCNT_1_ADDR (HDMI_I2CM_SS_SCL_HCNT_1_ADDR)

- Address Offset: 0x7E0B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12_0000h base + 7E0Bh offset = 12_7E0Bh

Bit	7	6	5	4	3	2	1	0
Read Write	i2cmp_ss_scl_hcnt[15:8]							
Reset	0	0	0	0	0	0	0	0

HDMI_I2CM_SS_SCL_HCNT_1_ADDR field descriptions

Field	Description
i2cmp_ss_scl_hcnt[15:8]	Value after Reset: 8'h00

33.5.332 I2CM_SS_SCL_HCNT_0_ADDR (HDMI_I2CM_SS_SCL_HCNT_0_ADDR)

- Address Offset: 0x7E0C
- Size: 8 bits
- Value after Reset: 0x6C
- Access: Read/Write

Address: 12_0000h base + 7E0Ch offset = 12_7E0Ch

Bit	7	6	5	4	3	2	1	0
Read Write	i2cmp_ss_scl_hcnt[7:0]							
Reset	0	1	1	0	1	1	0	0

HDMI_I2CM_SS_SCL_HCNT_0_ADDR field descriptions

Field	Description
i2cmp_ss_scl_hcnt[7:0]	Value after Reset: 8'h6C

33.5.333 I2CM_SS_SCL_LCNT_1_ADDR (HDMI_I2CM_SS_SCL_LCNT_1_ADDR)

- Address Offset: 0x7E0D
- Size: 8 bits

33.5.339 BASE_POINTER_ADDR (HDMI_BASE_POINTER_ADDR)

The I2C Slave Registers allow register memory pagination, and function in the incremental burst operation mode that increases the data throughput when consecutive addressed registers need to be read or write.

The I2C base pointer operation mode is a aimed to allow register memory pagination. As long as this operational mode is enabled the value written to this register will be used as the seven most significant bits of the internal Special Function Register address interface (sfraddr[14:8]) for all read or write operations. I2C data transfer protocol used shall be the 7-bit addressed as defined in the section 9 of the I2C-bus Specification, version 2.1.

Chapter 34
HDMI 3D Tx PHY (HDMI_PHY)

34.1 Overview

34.1.1 General Description

The HDMI 3D Tx PHY (HDMI_PHY) is the physical layer of a single-link HDMI transmitter interface and comprises three line drivers for data transmission and an additional line driver for clock transmission. The HDMI_PHY is designed to perform the serialization and transmission of video data and control information through an HDMI interface. It interfaces with an HDMI Tx link controller through a common graphic controller interface supporting 30- or 60-bit data transfers. A clock line driver is used for reference clock transmission.

34.1.2 Applications

The HDMI_PHY is targeted to digital video/audio transmission for high resolution display applications, supporting major display formats up to 1080 i/p in DTV applications and QXGA in graphic display applications, with true-color or deep-color resolutions. The HDMI_PHY supports 3D video formats. At maximum pixel rate, the HDMI channel bit rate is 3.4 Gbps, providing a maximum throughput of 9.2 Gbps.

The HDMI_PHY is an ideal solution for implementing the physical layer of a high-reliability digital video/audio interface based on HDMI technology, with reduced line count and minimum cable-wire and EMI shielding requirements. The HDMI_PHY delivers the bandwidth needed in every time mode that demands high resolution panels, while keeping clock sources at a low frequency.

The figure below shows a typical application for HDMI_PHY.

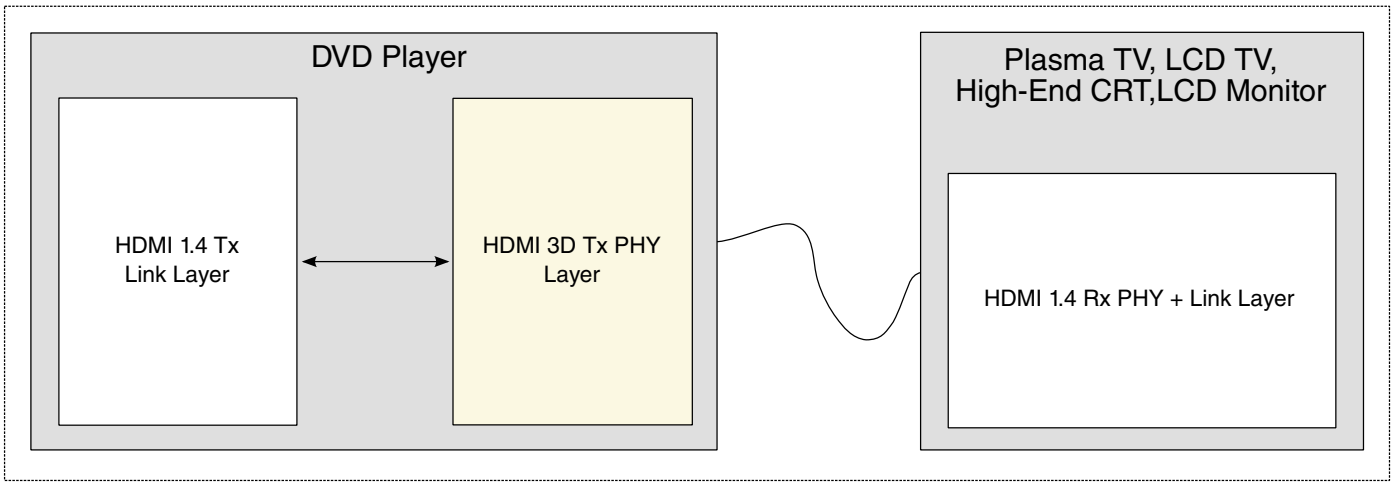

Figure 34-1. Typical Application for HDMI 3D Tx PHY

34.1.3 Standards Compliance

The HDMI_PHY is fully compliant with all the required specifications of the following standards:

- *High-Definition Multimedia Interface Specification*, Version 1.4a
- *Digital Visual Interface*, Revision 1.0
- *HDMI Compliance Test Specification*, Version 1.4a

34.1.4 Features

The HDMI_PHY provides the following features:

- Support for up to 720p at 100 Hz and 720i at 200 Hz or 1080p at 60 Hz and 1080i/720i at 120 Hz HDTV display resolutions and up to QXGA graphic display resolutions
- Support for 3D video formats
- Link controller flexible interface with 30- or 60-bit SDR data access
- Up to 9.2 Gbps aggregate bandwidth
- Driver with pre-emphasis and edge rate control for extra-long cable support
- Programmable source terminations
- HPD input analog comparator
- Rx sensing
- 13.5-266 MHz input reference clock

- 50% duty-cycle output clock
- Embedded Tx scope
- Embedded A/D converter and analog testbus for ATE testing
- Built-in pattern generator
- Small core area
- Low power consumption

34.1.5 HDMI 3D Tx PHY System-Level Overview

This section provides a system-level overview of the HDMI 3D Tx PHY.

34.1.5.1 System-Level Block Diagram

The figure below shows a system-level block diagram of the HDMI Tx System.

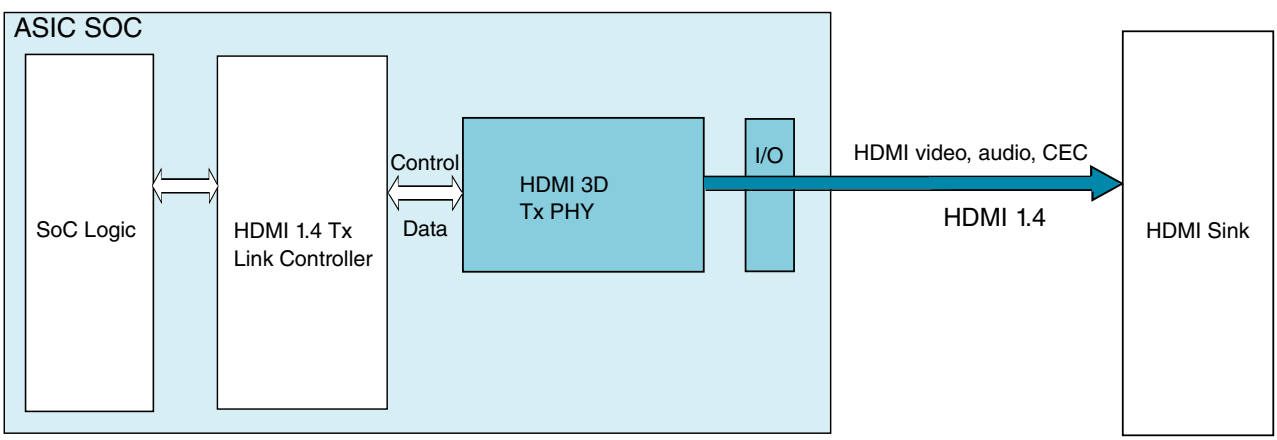

Figure 34-2. HDMI Tx System-Level Block Diagram

The HDMI_PHY macro interfaces with the HDMI Tx link controller, which provides control signals and video data to be transmitted through the TMDS lanes. Analog I/O's interface with the external world.

34.1.5.2 HDMI 3D Tx PHY

The HDMI 3D Tx PHY is the physical layer of an HDMI/DVI-compliant digital transmitter (source).

For a functional block diagram and a functional description of the HDMI 3D Tx PHY, see Functional Description.

34.1.5.2.1 Interfaces

The HDMI interface on the HDMI_PHY block is defined by the TMDS differential lanes and the HPD/DDCCEC connections. HDMI video data is provided through three differential TMDS pairs for data and one TMDS differential pair for clock. HPD/DDC_CEC enables detection of the HDMI sink. These signals interface the external world and connect to the HDMI connector.

On the system interface, the HDMI_PHY connects to the HDMI Tx link controller. This block provides an input reference clock to the PHY (pixel clock). Based on the defined video mode, a pixel repetition clock and a TMDS word clock are output to the controller. The controller then generates video data on this TMDS word clock and outputs both data and clock to the HDMI_PHY. Data is then serialized and sent to the HDMI interface.

In addition, the system side includes one standard I^2C interface for configuration and testability of the PHY. Other signals correspond to control logic and are either input to the PHY or provided by the PHY to the controller block for observability.

34.1.5.3 HDMI 1.4 I/O Pads

HDMI 3D Tx PHY provides a set of analog ESD pads for use.

34.1.5.3.1 I/O Pads Description

HDMI 3D Tx PHY I/O pads are provided as follows:

- Pad order: VPH, VP, GD, VPH, VP, GD, VPH, VP, GD, HDMI_TX_CLK_P, HDMI_TX_CLK_N, GD, HDMI_TX_DATA0_N, HDMI_TX_DATA0_P, GD, HDMI_TX_DATA1_N, HDMI_TX_DATA1_P, GD, HDMI_TX_DATA2_N, HDMI_TX_DATA2_P, GD, VP, VPH, REXT, HDMI_TX_HPD, HDMI_TX_DDC_CEC

As shown in the figure below, for maximum performance, HDMI 3D Tx PHY I/O pads contain decoupling capacitance between VP and GD and a filter between VP and VP_FILT (one for each VP_FILT signal).

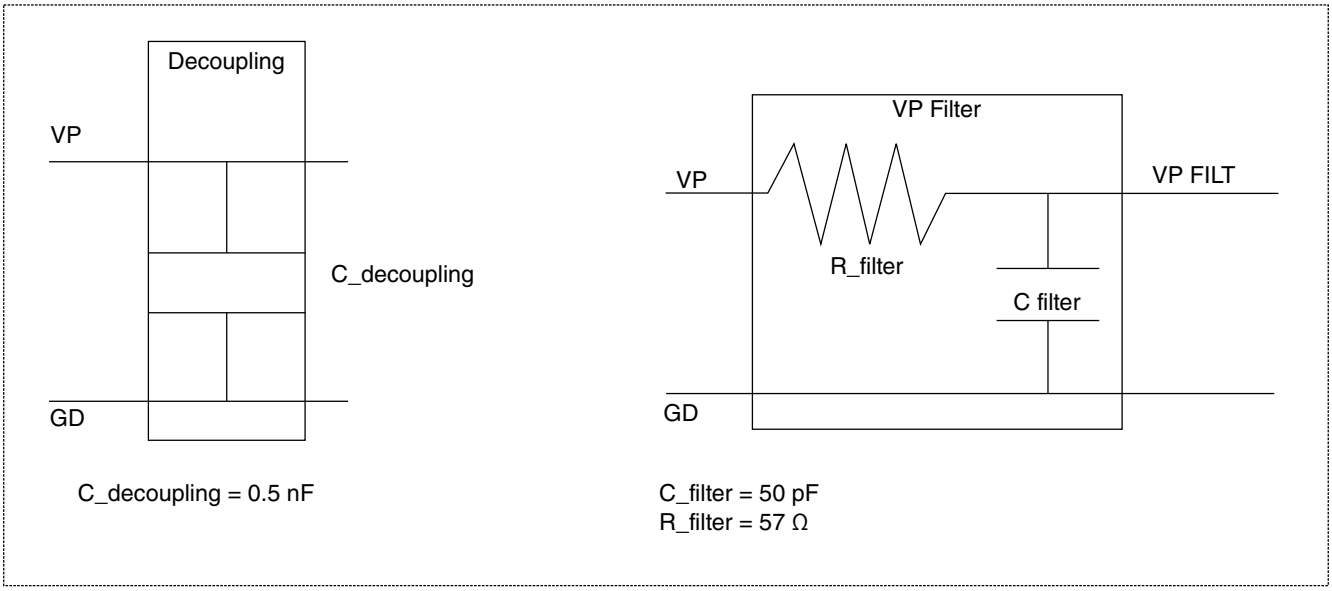

Figure 34-3. I/O Pads: Decoupling Capacitance Between VP and GD, Filter Between VP and VP_FILT

34.2 External Signals

The table found here describes the external signals of HDMI.

Table 34-1. HDMI External Signals

Signal	Description	Pad	Mode	Direction
HDMI_TX_CEC_LINE (CEC_LINE)	CEC line between source and sink	EIM_A25	ALT6	I/O
		KEY_ROW2	ALT6	
HDMI_TX_CLK_N (CLK_N)	Negative Clock Signal	HDMI_CLKM	No Muxing	I
HDMI_TX_CLK_P (CLK_P)	Positive Clock Signal	HDMI_CLKP	No Muxing	I
HDMI_TX_DATA0_N (DATA0_N)	Negative Data Signal 0	HDMI_D0M	No Muxing	I/O
HDMI_TX_DATA0_P (DATA0_P)	Positive Data Signal 0	HDMI_D0P	No Muxing	I/O
HDMI_TX_DATA1_N (DATA1_N)	Negative Data Signal 1	HDMI_D1M	No Muxing	I/O
HDMI_TX_DATA1_P (DATA1_P)	Positive Data Signal 1	HDMI_D1P	No Muxing	I/O
HDMI_TX_DATA2_N (DATA2_N)	Negative Data Signal 2	HDMI_D2M	No Muxing	I/O

Table continues on the next page...

Table 34-1. HDMI External Signals (continued)

Signal	Description	Pad	Mode	Direction
HDMI_TX_DATA2_P (DATA0_P)	Positive Data Signal 2	HDMI_D2P	No Muxing	I/O
HDMI_TX_DDC_CEC (DDC_CEC)	CEC Signal	HDMI_DDCCEC	No Muxing	I/O
HDMI_TX_DDC_SCL (DDC_SCL)	SCL Signal	EIM_EB2	ALT4	I/O
		KEY_COL3	ALT2	
HDMI_TX_DDC_SDA (DDC_SDA)	SDA Signal	EIM_D16	ALT4	I/O
		KEY_ROW3	ALT2

34.2.1 Top-Level I/O Diagram

The figure below shows the HDMI 3D Tx PHY top-level signals.

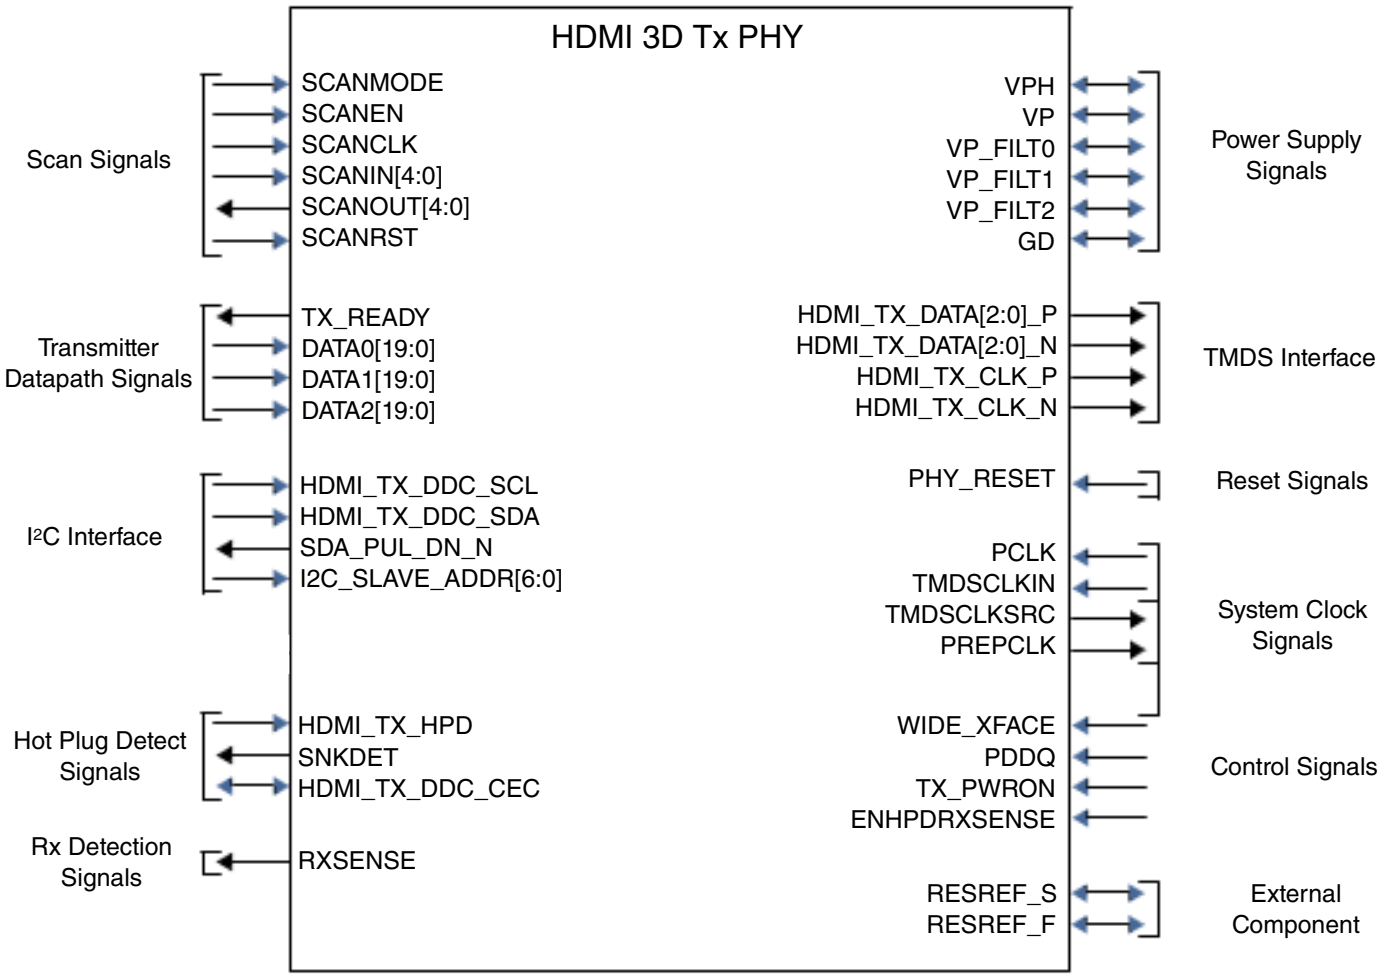

Figure 34-4. Top-Level I/O Diagram

34.2.2 Top -Level Signal Descriptions

This section describes the top-level signals.

In addition to describing the function of each signal, the signal descriptions include the following information:

- **Voltage range**: Describes the voltage range expected on this pin.
- **Synchronous**: Indicates that the signal is asserted or deasserted with respect to a clock edge.
- **Asynchronous**: Indicates that the signal is not asserted or deasserted with respect to a clock edge.

34.2.2.1 TMDS Interface

The table below describes the Transmission Minimized Differential Signaling (TMDS) interface signals.

Table 34-2. TMDS Interface

Signal	I/O	Description
HDMI_TX_DATA[2:0]_P	O	**Function**: Positive TMDS differential line driver data output for data channels 0,1, and 2. **Voltage range**: For the permitted voltage range, refer to *High-Definition Interface Specification*, Version 1.4, "Electrical Specification" section. **Active state**: N/A **Synchronous to**: N/A
HDMI_TX_DATA[2:0]_N	O	**Function**: Negative TMDS differential line driver data output for data channels 0,1, and 2. **Voltage range**: For the permitted voltage range, refer to *High-Definition Interface Specification*, Version 1.4, "Electrical Specification" section. **Active state**: N/A **Synchronous to**: N/A
HDMI_TX_CLK_P	O	**Function**: Positive TMDS differential line driver clock output **Voltage range**: For the permitted voltage range, refer to *High-Definition Multimedia Interface Specification*, Version 1.4, "Electrical Specification" section. **Active state**: N/A **Synchronous to**: N/A
HDMI_TX_CLK_N	O	**Function**: Negative TMDS differential line driver clock output **Voltagerange**: For the permitted voltage range, refer to *High-DefinitionMultimediaInterfaceSpecification*, Version 1.4, "Electrical Specification" section. **Activestate**: N/A **Synchronousto**: N/A

34.2.2.2 Reset Signals

The table blow describes the reset signals.

Table 34-3. Reset Signals

Signal	I/O	Description
PHY_RESET	I	**Function**: PHY reset. This signal places the digital section of the macro into a reset state. **Voltagerange**: 0-VP

Table 34-3. Reset Signals

Signal	I/O	Description
		Activestate: High **Synchronousto**: Asynchronous

34.2.2.3 External Component

The table below describes the top-level signals that connect to an external component.

Table 34-4. External Component

Signal	I/O	Description
RESREF_S	I/O	**Function**: 1600- precision resistor to ground. During resistor tuning, current is forced through the external resistor using RESREF_F, while the induced voltage is sensed on RESREF_S. **Voltage range**: N/A **Active state**: N/A **Synchronous to**: Asynchronous
RESREF_F	I/O	**Function**: Reference resistor connection **Voltage range**: N/A **Active state**: N/A **Synchronous to**: Asynchronous

34.3 Functional Description

This section describes the functional architecture of the HDMI 3D Tx PHY.

34.3.1 Functional Overview

The figure found in this section shows a functional block diagram of the HDMI_PHY.

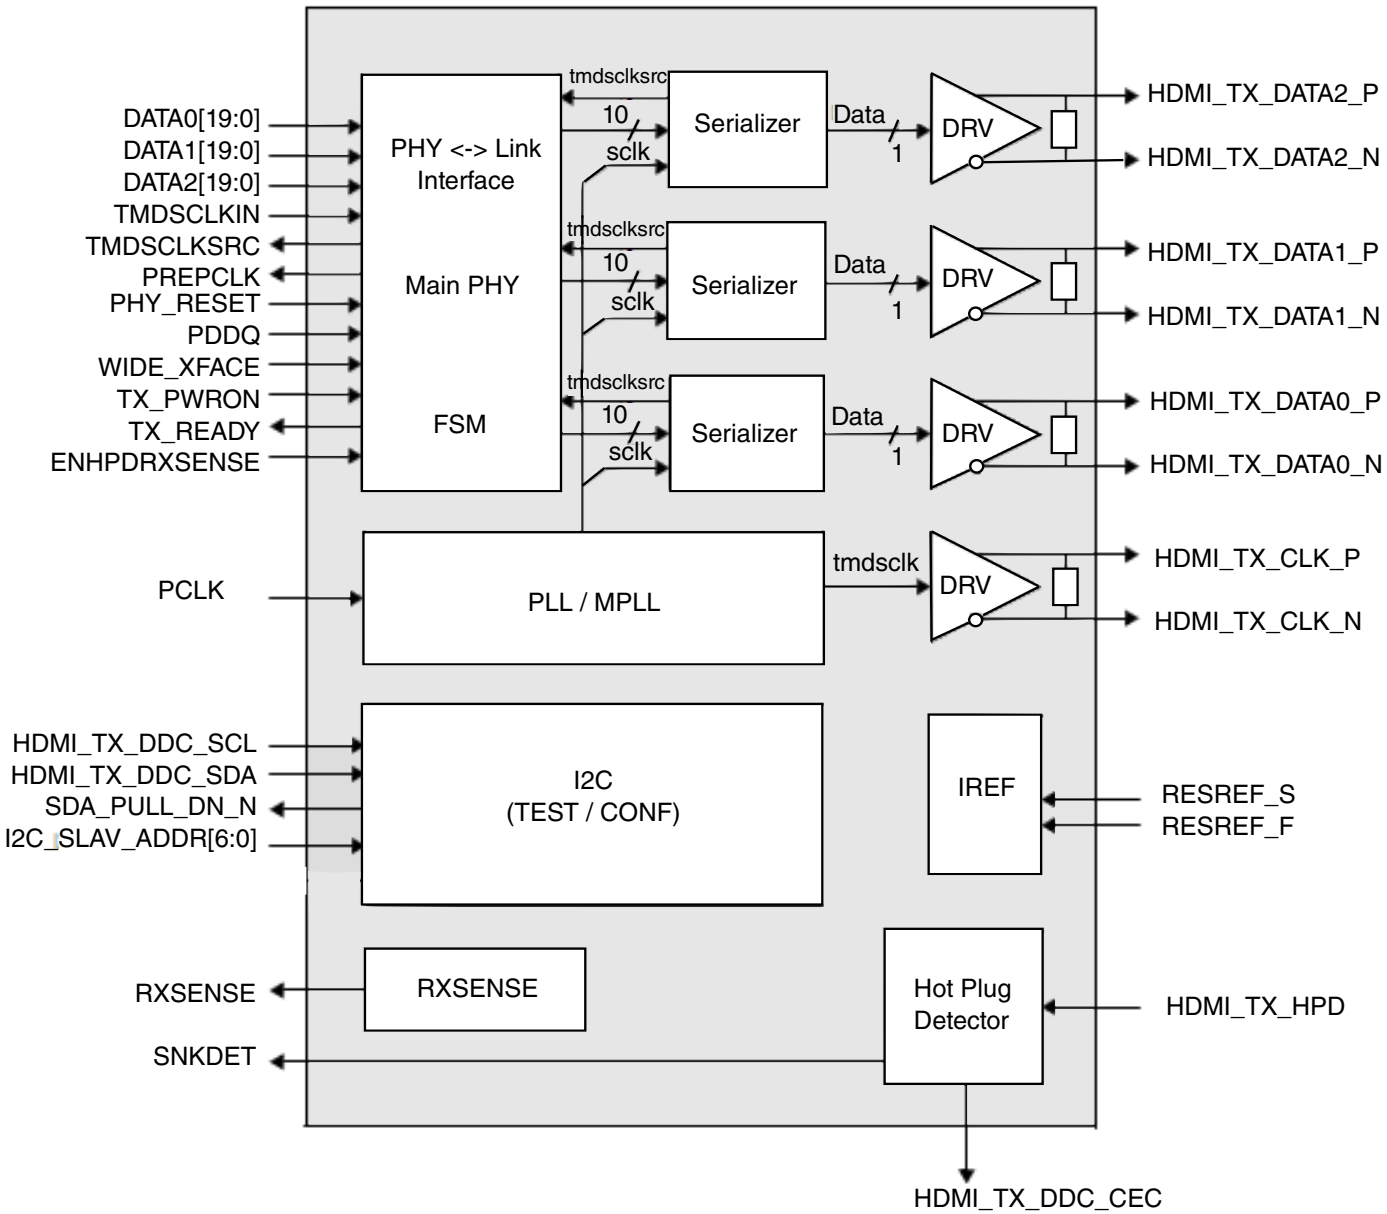

Figure 34-5. HDMI 3D Tx PHY Functional Block Diagram

The HDMI_PHY is the physical layer of an HDMI/DVI-compliant digital transmitter (source), capable of encoding and transmitting high-speed data streams carrying RGB video, audio, and control information. The HDMI Link Controller interface conforms to a 30- or 60-bit synchronous data interface (DATA0[19:0],DATA1[19:0],DATA2[19:0]).

The PHY includes two PLLs that synthesize the high-speed serial bit clock (required by the transmitter) from a reference pixel clock with a frequency of 13.5-266 MHz, for a transmitter capable of transmitting up to 9.2 Gbps using three lanes.

The HDMI_PHY drives audio and video across three TMDS data channels. Each serial TMDS link has a data rate range of 0.25-3.4 Gbps. The HDMI_PHY also drives the TMDS clock at 1/10th of the serial data rate with a frequency range of 25-266 MHz.

Within the HDMI_PHY, additional support blocks exist: the Bandgap block (for blocks biasing), the Resistor Calibration block, the ADC, and the analog test bus.

The HDMI_PHY accepts an input pixel clock (PCLK) with a frequency range of 13.5-266 MHz and accepts three channels of parallel data (TXDATA0[19:0], TXDATA1[19:0], TXDATA2[19:0]) that is synchronous with the TMDSCLKIN input clock. The TMDSCLKIN clock has a frequency range of 12.5-266MHz.

The TMDSCLKSRC clock output should be used by the HDMI transmitter controller as the source for TMDSCLKIN. The relation between TMDSCLKSRC and TMDSCLKIN should be constant between resets.

The HDMI_PHY's status and configuration is accessed through its I^2C interface. In Scan mode of operation, SCANCLK is bypassed to all PHY output clocks.

PLL/MPLL Operation

The PLL/MPLL can be configured in Coherent mode or Non-Coherent mode (default). In Coherent mode, the TMDS clock is the MPLL feedback clock, which is coherent with the MPLL's high-speed output clock, because both clocks are shaped by the MPLL response. In Non-Coherent mode, the TMDS clock is the MPLL reference clock, which is not coherent with the MPLL's high-speed output clock.

Driver Operation

The driver differential source termination, edge rate, pre-emphasis, and voltage level can be configured for maximum performance.

34.3.2 Operating Modes

This section describes various operating modes of the HDMI_PHY.

The HDMI_PHY can be placed in two different operating modes: Power-Down and Active.

The PHY_RESET signal is used to place the digital section of the IP in a well-defined state. Reset is active when the PHY_RESET signal is asserted high. PHY_RESET assertion also clears the configuration registers. Through the control registers, assertion of a soft reset to the macro is possible. This soft reset clears all system FSMs except I^2C and control registers.

For each separate video mode in which the HDMI_PHY is set to transmit, due to different operating frequency, color depth and pixel repetition that characterizes each one, you might need to configure the PHY block for correct operation and optimized performance. It is recommended that PHY configuration through the I^2C interface be done while the PHY is in Power-down mode. Configuration involves programming the PLL/MPLL internal blocks as well as the analog drivers' source termination value and edge rate control, for example. This programming is done through the I^2C interface. For more information about the I^2C interface, see I2C Interface Signals, for information about the PLL/MPLL configurations that must be made for each video mode of operation, see PLL/MPLL Generic Configuration Settings , and for information about the driver configurations, see Control Registers and Appendix A: Driver Voltage Level Configuration.

34.3.2.1 Power-Down Mode

This mode is the lowest power consumption mode. The PHY enters this mode when the TX_PWRON and ENHPDRXSENSE signals are set to 1'b0 and the PDDQ and PHY_RESET signals are set to 1'b1.

This mode is characterized by having all analog blocks disabled and digital logic quiet. Current consumption in this mode corresponds to the analog blocks standby current and digital logic leakage current.

To enable the HDMI 3D Tx PHY to enter Power-down mode, after TX_PWRON is set to 1'b0, the PCLK input must continue toggling until the TX_READY output signal is set to 1'b0 (indicating that the PHY has been correctly set in Power-down mode). If this sequence is not followed, TX_READY is not set to 1'b0, and the PHY remains in Active mode.

During Power-down mode, the ENHPDRXSENSE control signal can be set to 1'b1, enabling the HPD and RXSENSE-related circuitry. This setting enables the link controller to observe when an HDMI Rx is connected to the Tx and to power up the HDMI 3D Tx PHY after detecting the Rx.

During Power-down mode, if ENHPDRXSENSE is enabled, it is recommended that source terminations on both data and clock lines are enabled by setting tx_rescal[6:0] and ck_rescal[6:0] to 7'b1111111 on registers

0x04 and 0x05, respectively. Because the analog driver within the macro is disabled, enabling the source terminations will help pull-down the floating TMDS data/clock lines to a voltage level that will guarantee proper RXSENSE operation and output signaling when the Rx connects/disconnects from the PHY.

34.3.2.2 Active Mode

Active mode is the normal operational mode. To start processing received data from the link controller interface, the macro must first reach this state. The PHY is ready to transmit when TX_READY is asserted high.

In this state, the interface signals (DATA0[19:0], DATA1[19:0], DATA2[19:0]) are sent to the HDMI interface. Data is transferred according to the HDMI specification.

After entering Active mode, the HDMI Tx macro starts serially transmitting data received from the link controller to the TMDS interface. The way in which input data is encoded (depends on whether data corresponds to Video Data Period, Data Island Period, or Control Periods) depends on the HDMI protocol sequence. Data encoding is performed by the Link controller layer.

While operating in Active mode, the HDMI_PHY operates in one of the following modes (as defined in the HDMI specification, and as shown in the figure below):

- Video Data Period
- Data Island Period
- Control Period

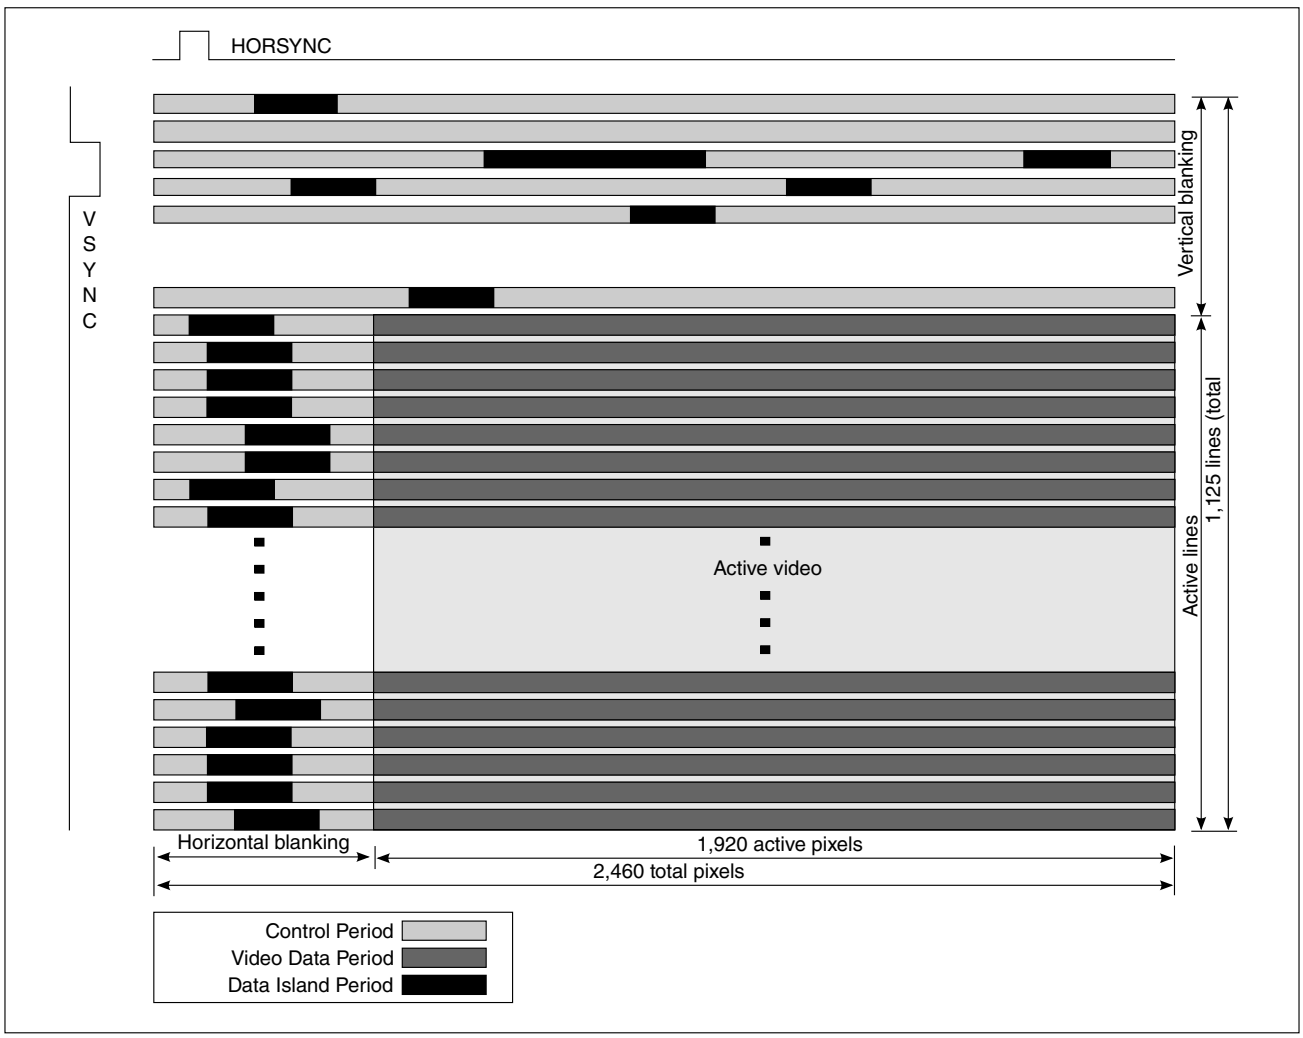

Figure 34-6. Active Mode

Video Data Period is used for the transmission of active pixel data. Transition Minimized (TMDS) data coding (8B10B) is used for 8-bit data transfers. In Deep-color modes, pixel data words are first packed in 8-bit multiple data groups. These groups are then fragmented into 8-bit length words for TMDS encoding.

Data Island Period is used for audio or other auxiliary data information transmission. Data is transferred in packet format using a similar Transition Minimized coding, in this case a TMDS Error Reduction Coding (TERC4). This is a 4B10B code.

Finally, Control Period is used when non-active video/audio or other auxiliary information needs to be transmitted. Only control information is transmitted in this mode. In Control Periods, data is transferred using a Transition Maximized (also TMDS) data

coding, in a form of 2B10B code. This property is very useful to enable proper word alignment on the sink (receiver) side. A Control Period is always entered between any other two periods that are not Control Periods.

34.3.2.2.1 Wide Interface Mode

To support the full HDMI bandwidth requirement, each of the three channels accepts 9-bit data and clock at a maximum rate of 340 MHz. In this case, the WIDE_XFACE input is set to 1'b0.

When WIDE_XFACE is set to 1'b1, each channel accepts 20-bit data and clock at a maximum rate of 170 MHz. This mode is meant to ease interface timing while maintaining the maximum HDMI bandwidth requirement.

When WIDE_XFACE is set to 1'b1, the TMDSCLKSRC clock frequency is not reduced to half simply through the WIDE_XFACE control. The frequency can be reduced to half through the I^2C interface, register 0x1E, cko_word_div_enb control bit. This control is independent from the WIDE_XFACE selection.

34.3.2.3 Power Sequence

The HDMI_PHY power sequence implementation controls the PLL/MPLL start of operation, resistor calibration, and clock alignment.

As shown in the figure below, during power-up, the Power Sequence finite state machine (FSM) advances through the PLL and MPLL power-up states by loading a counter at the beginning of each state (pwr_cnt) and advancing when the counter (pwr_cnt) decrements to 0. After the Resistor Calibration FSM is enabled in the RES_CAL state, the FSM waits for the assertion of rcal_adc_done before advancing. After the Clock Alignment FSM is enabled in the TX_CLK_ALIGN state, the Power Sequence FSM waits for the assertion of tx_ck_align_done before advancing to the TX_READY state. The TX_READY state asserts the TX_READY output signal, which indicates that the HDMI_PHY is ready to transmit the TMDS clock and data and that normal operation can begin.

If TX_PWRON is deasserted in the TX_READY state, the Power Sequence FSM moves to the DISABLE_TX state. The power-down sequence is initiated. This state disables the TMDS clock and data outputs. Next, the PWR_DN_PLL resets the PLL and MPLL blocks. Finally, the FSM returns to the PWR_DN state and waits for TX_PWRON assertion to begin the power-up sequence.

The HDMI_PHY enters Power-down mode only when the TX_READY output is deasserted. To enable the power sequence to reach this state, when TX_PWRON is set to 1'b0 while the HDMI_PHY is in the "TX_READY" state, the PCLK input must continue

toggling until TX_READY is deasserted. This sequence is required to enable the Power Sequence FSM to continue its execution and move from TX_READY to DISABLE_TX, later to PWR_DN_PLL, and finally to PWR_DN that corresponds to the power-down state.

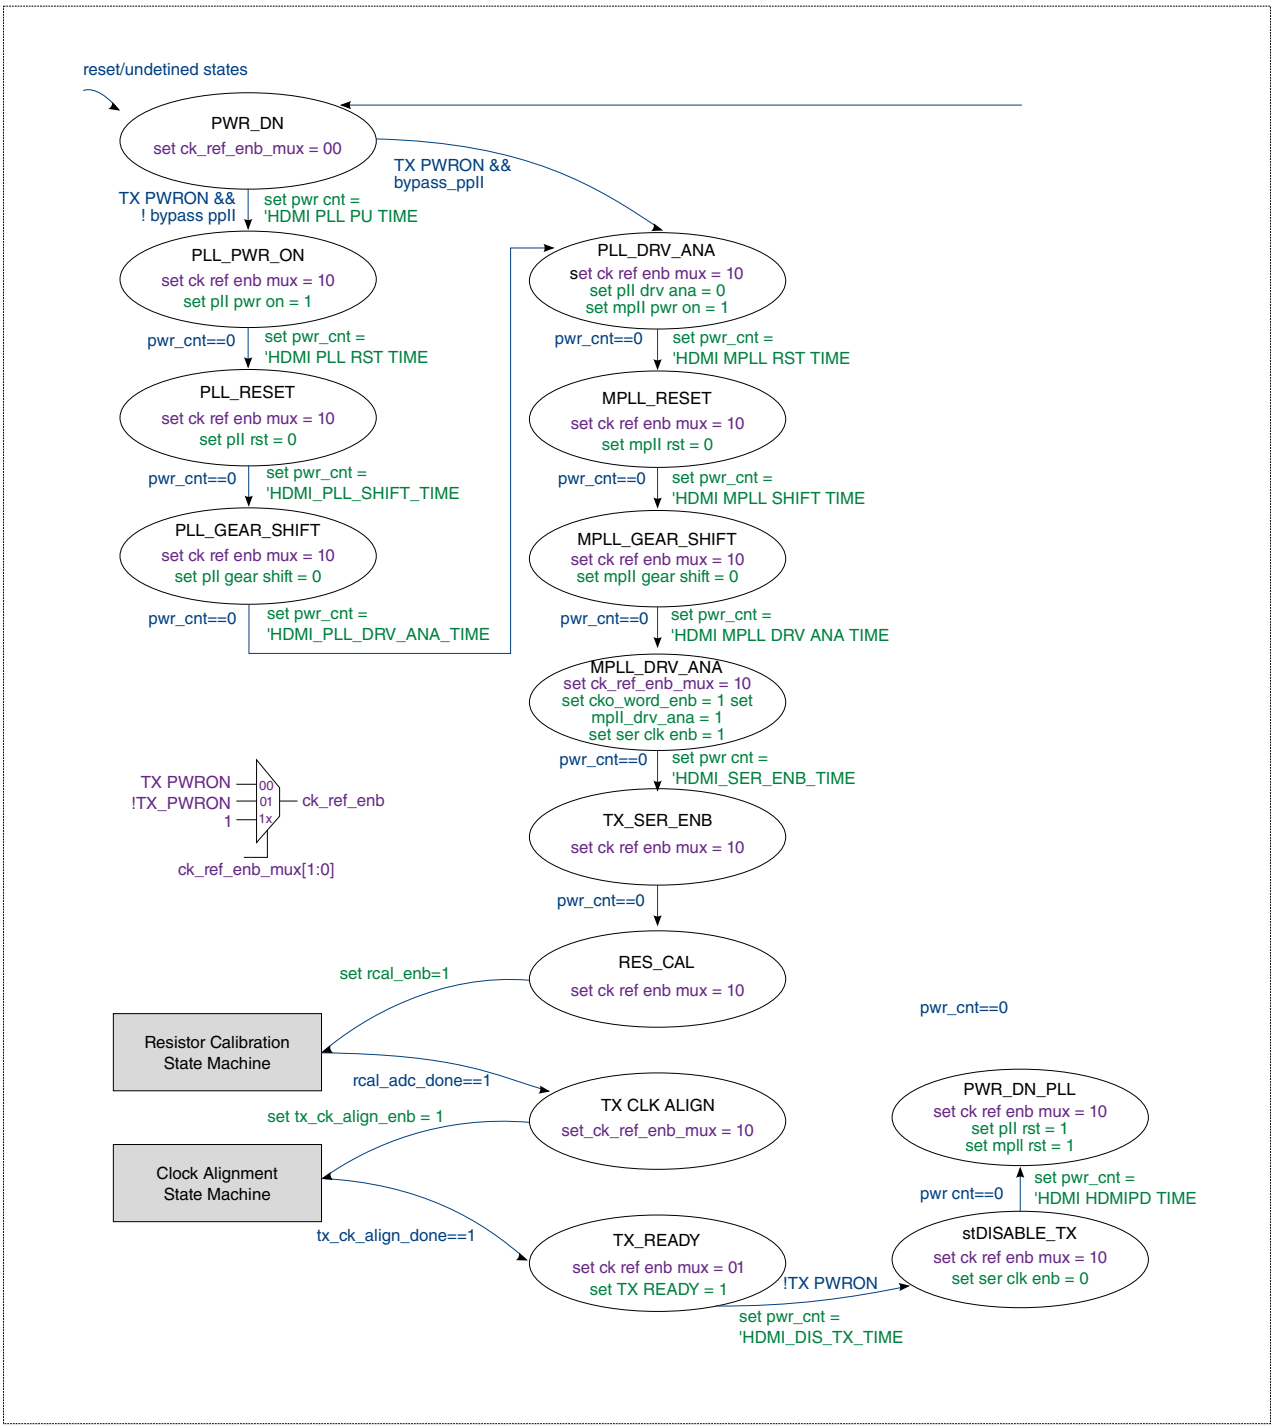

Figure 34-7. Power Sequence Finite State Machine

The following signals can be overridden through the control registers: bypass_ppll, pll_pwr_on, pll_rst, pll_gear_shift, pll_drv_ana, mpll_rst, mpll_gear_shift, cko_word_enb, mpll_drv_ana, ser_ckl_enb, rcal_enb, tx_clk_align_enb, ser_clk_enb, and ck_ref_enb.

The rcal_adc_done and tx_ck_align_done signals can be observed through the control registers or through the digital test bus (dtb[1:0], controlled through control registers).

The TX_PWRON and TX_READY signals belong to the HDMI 3D Tx PHY macro interface.

The power sequence can also be started through control registers, using the tx_pwron0, tx_pwron1, tx_pwron2, and ck_pwron signals.

TX_READY can also be overridden through control registers.

The clock source that clocks the Power Sequence FSM is controlled by the refclk_enb signal. This signal is asserted when TX_PWRON is asserted or when the state machine is in a state other than PWR_DN. This signal can be overridden through the control registers.

NOTE

Due to a potential different state on some analog nodes, it is recommended that the power-up sequence be run twice (after the first TX_READY assertion, the PHY can be powered down, then powered up again).

The clock alignment procedure can be done differently for each of the power-up sequence runs. For the first run, the clock alignment can be set to be performed channel-by-channel (tx_ck_align_mode = 1'b1, register 0x1C); for the second power-up, the clock alignment can be set to be performed for all channels at the same time (tx_ck_align_mode = 1'b0, register 0x1C) to ensure inter-pair skew close to 0 UI.

34.3.2.3.1 PLL/MPLL

During power-up, the PLL block and (optionally) MPLL block receive the pwron, rst, gear_shift, and drv_ana signals, as shown in the figure below. The minimum and maximum timing for these signals is listed in the table below. The power sequence then initiates the resistor calibration and clock alignment steps.

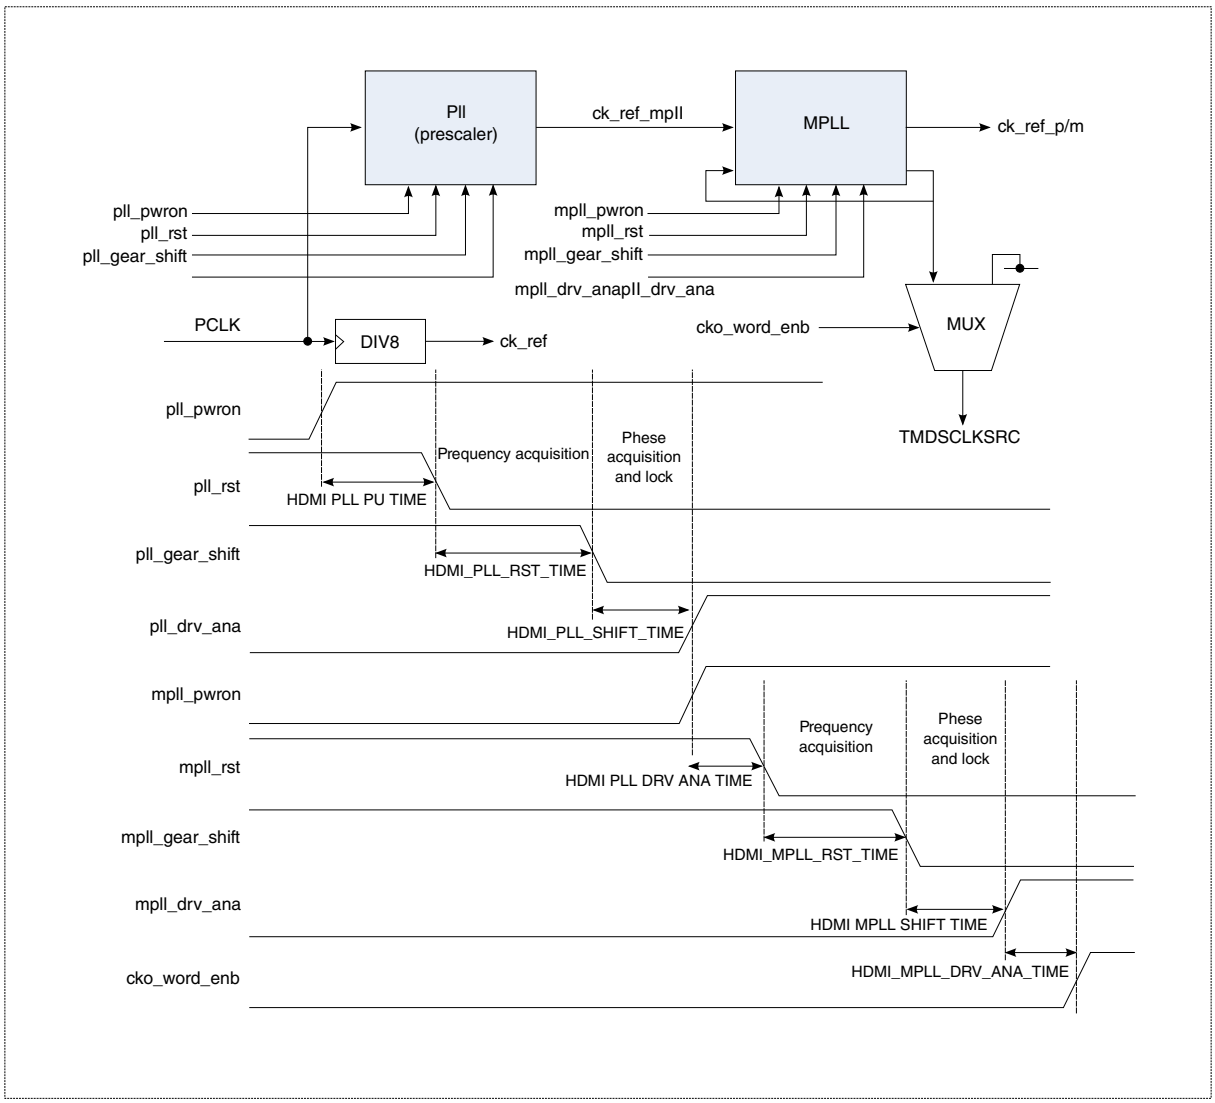

Figure 34-8. PLL/MPLL Power-Up Sequence

The following signals can be overridden through the control registers: pll_pwron, pll_rst, pll_gear_shift, pll_drv_ana, mpll_pwron, mpll_rst, mpll_gear_shift, mpll_drv_ana, and cko_word_enb.

ck_ref, ck_ref_p/m, and ck_ref_mpll are internal signals, while PCLK and TMDSCLKSRC belong to the HDMI 3D Tx PHY macro interface.

The table below provides the PLL/MPLL power-up times.

Table 34-5. PLL/MPLL Power-Up Time

Count Name	Count Value	Minimum Time (µs) (T(refclk) = 0.00294 µs)	Maximum Time (µs) (T(refclk = 0.07407 µs)
HDMI_PLL_PU_TIME	125	2.294	74.074
HDMI_PLL_RST_TIME	1250	22.940	740.740
HDMI_PLL_SHIFT_TIME	50	0.918	29.630
HDMI_PLL_DRV_ANA_TIME	125	2.294	74.074
HDMI_MPLL_RST_TIME	2500	45.880	1481.480
HDMI_MPLL_SHIFT_TIME	1000	18.352	592.592
HDMI_MPLL_DRV_ANA_TIME	50	0.918	29.630
HDMI_SER_ENB_TIME	50	0.918	29.630
Total PLL and MPLL Power-up Time		**94.513**	**3,051.849**

34.3.2.3.2 Resistor, ADC Calibration

Users can set the single-ended source termination resistance via the d_tx_term[2:0] control register bits, according to the table below.

Table 34-6. Single-Ended Source Termination Resistance Settings

N	d_tx_term[2:0]	R(Ω)
0	000	50
1	001	56.14
2	010	66.67
3	011	80
4	100	100

7	111	Open

To accurately set the specified termination, the resistor calibration measures the actual resistance of the external resistor. The resistance is measured using successive approximations of a 7-bit termination value by enabling each bit (one-hot) from MSB to LSB.

Users select the termination value by setting the d_tx_term[2:0] control register bits. The HDMI 3D Tx PHY includes differential source termination on the drivers.

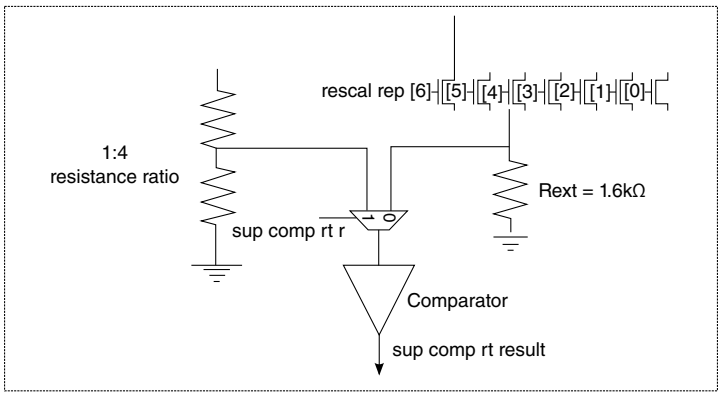

Figure 34-9. External Resistor Measurement

The exact value of Rext is determined to create an exact termination.

The analog support block applies a current to the external resistor and compares the resultant voltage. The result (sup_comp_rt_result) is registered by the Calibration block.

The source termination is then set according to the following equation:

tx_rescal = rescal_rep x (1 - 0.125 x *N*)

Instead of subtracting by (1/8th x rescal_rep x *N*), rescal_rep is initially multiplied by 8 (left shift by 3 bits), then tx_rescal is subtracted *N* number of times. *N* sets clk_cnt, which sets the number of subtraction loops, as shown in the table below. This table represents the clk_cnt required to trigger tx_rescal_done. The final result is divided by 8 (right shift by 3 bits) and rounded up if necessary.

Table 34-7. clk_cnt Necessary to Trigger tx_rescal_done

N/d_tx_term	clk_cnt to Trigger tx_rescal_done
0	<all>
1	0
2	1
3	2
4	3
5	4
6	5
7	<all>

The figure below shows the FSM for the resistor and ADC calibration.

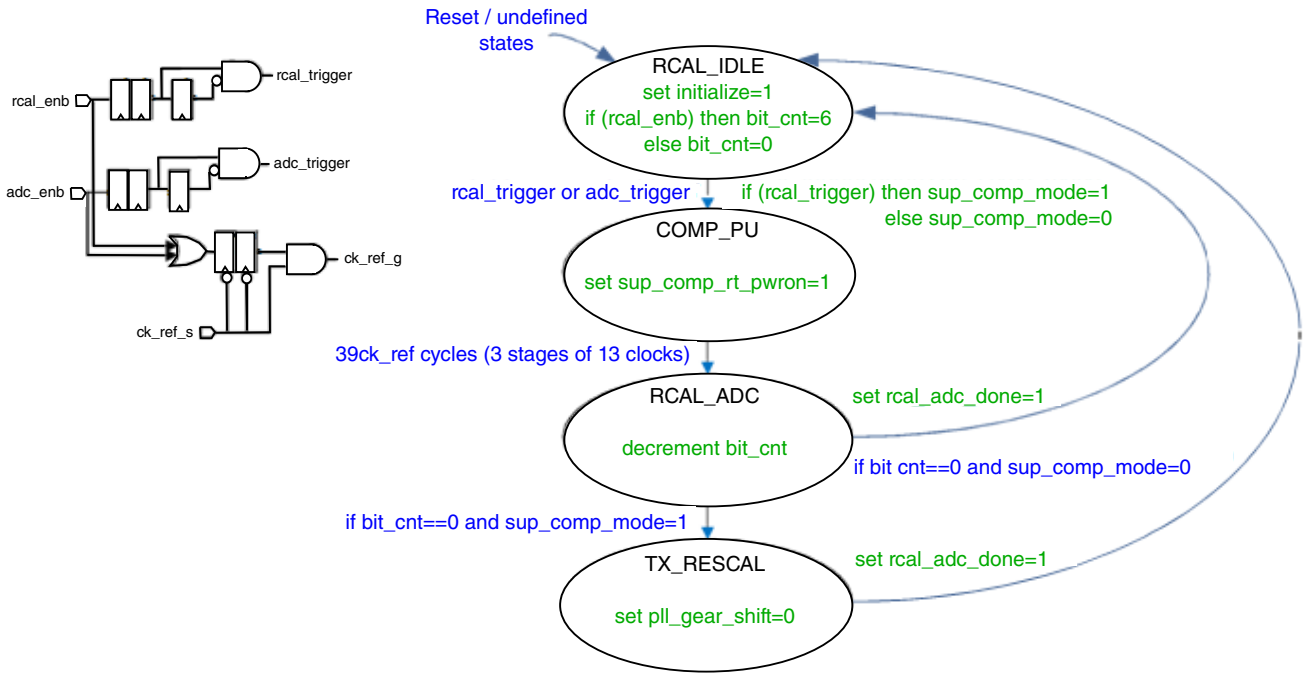

Figure 34-10. Finite State Machine for the Resistor and ADC Calibration

The rcal_enb signal is asserted by the Power Sequence FSM, but this signal can be overridden through the control registers.

The rescal_rep, sup_comp_mode, sup_comp_rt_r, sup_comp_rt_result, tx_rescal, sup_comp_rt_pwron, and adc_enb signals can be overridden through the control registers.

The rcal_adc_done signal can be observed through the control registers or through the digital test bus (dtb[1:0], controlled through control registers).

34.3.2.3.3 Clock Alignment

There are two clocks in the transmit clock path, TMDSCLKIN (from the parallel HDMI controller interface), and internal ck_tx_out (a divided-down clock, generated from the MPLL clock). These two clocks must be properly synchronized, aligning them before transmitting data through the HDMI 3D Tx PHY.

The alignment results in the internal tx_ser_clk (buffered version of TMDSCLKIN) being delayed in the range of 0.6-0.8 UI with respect to the TMDSCLKIN clock.

The Clock Alignment module adjusts the alignment between TMDSCLKIN and tx_ser_clk by generating internal clock kill signals called tx_ser_clk_kill[2:0]. On the rising edge of each tx_ser_clk_kill[2:0] signal, the corresponding tx_ser_clk[2:0] is delayed by 0.2 UI.

The clock alignment enable input, tx_ck_align_enb, is generated by the power sequence, but this input can also be overridden through the control registers.

Because it is assumed that channel 1 (the middle channel) has the median delays among the three channels, the state machine will compare TMDSCLKIN and tx_ser_clk[1] only when the register bit, tx_ck_align_mode, is low (default). In this case, tx_ser_clk_kill[2:0] is asserted simultaneously. When tx_ck_align_mode is high, each channel is aligned individually. Channel 2 is aligned first, followed by channel 0 and lastly channel 1. The tx_ck_align_mode signal is controlled through the control registers.

The internal clock kill signals, tx_ser_clk_kill2, tx_ser_clk_kill1, and tx_ser_clk_kill0, are generated by the Clock Alignment state machine, but these signals can be overridden through the control registers.

34.3.2.4 Color Depth and Color Mode Selection

This section describes HDMI 3D Tx PHY color depth and color mode selection.

34.3.2.4.1 Pixel Repetition Clock Generation Selection

For small displays operating a TMDS clock below 25 MHz or applications that require an increase in available bandwidth for audio and auxiliary information transmission, the HDMI_PHY can generate pixel repetition clocks.

Pixel repetition signals are dedicated to configure pixel repetition rates. These signals affect only the relation between PCLK and PREPCLK.

PCLK 1 / (pixel repetition) x PREPCLK

34.3.3 Configuration and Test Mode

This section describes HDMI 3D Tx PHY configuration and test mode operation.

The HDMI 3D Tx PHY can be configured and set in test mode through the supported I^2C interface.

To avoid transient periods in the macro operation during reconfiguration procedures, it is highly recommended that the I^2C interface be used while the HDMI 3D Tx PHY is in Power-down mode.

Control Registers describes all the registers and corresponding fields that are available through the I^2C interface.

34.3.3.1 Power-Up Configuration

Before powering up the HDMI 3D Tx PHY, configure the PHY for proper operation and performance.

Configuring the PHY through the I^2C interface is as follows.

NOTE

The recommended settings for the PLL/MPLL mode of operation and driver configurations provided in this section are presented as the default value that should be considered and initially configured. Unless stated otherwise, these recommended settings apply to all operating frequencies.

PLL/MPLL Mode of Operation

Configuration summary: Configure PLL/MPLL mode of operation as Single or Two-PLL in Coherent or Non-Coherent mode. For more information about these modes of operation, see Power-Up Requirements.

Table 34-8. PLL/MPLL Mode of Operation

Fields	Bits	Default
Register0x13		
bypass_ppll	11	1'b0
Register0x17		
cko_sel	2-1	2'b11

PLL/MPLL Clock Dividers and Analog Configuration

Configuration summary: Configured for each video mode. For information about the PLL and MPLL divider settings, see Table B-2 .

Table 34-9. PLL/MPLL Clock Dividers and Analog Configuration

110	200
111	Open circuit

Fields	Bits	Default
Register 0x19		
d_tx_term[2:0]	2-0	3'b101

Driver Voltage Level

Configuration summary: For information about the driver voltage level settings, see Appendix A: Driver Voltage Level Configuration. Driver voltage level configuration is dependent on driver differential source termination and driver pre-emphasis settings.

Table 34-12. Driver Voltage Level

Fields	Bits	Default
Register 0x0E		
sup_tx_lvl[4:0]	9-5	25-148.5 MHz: 5'b10000 222.75-297 MHz: 5'b01111 340 MHz: 5'b01110
sup_ck_lvl[4:0]	4-0	25-148.5 MHz: 5'b10000 222.75-297 MHz: 5'b01111 340 MHz: 5'b01110

Driver Pre-Emphasis

Configuration summary: Enables trailer drivers to enable pre-emphasis operation. Pre-emphasis is achieved by reducing the drive level of a non-transition bit with respect to a transition bit. The following table summarizes the total output current configured with pre-emphasis (I is current of unit current source).

Table 34-13. Driver Pre-Emphasis

Total Output Current	tx_symon	tx_traon	tx_trbon
0 * I	0	0	0
36 * I	1	0	0
36 * I + 3 * I	1	0	1
36 * I + 6 * I	1	1	0
36 * I + 6 * I + 3 * I	1	1	1

The amount of pre-emphasis is programmed through the tx_traon and tx_trbon signals in the control register, address 0x09 as follows.

Field	Bit	Default

Table continues on the next page...

tx_trbon	1	25-148.5 MHz: 1'b0 222.75-340 MHz: 1'b1
tx_traon	2	1'b0

34.4 System-Level Implementation

34.4.1 System Operation

This section describes HDMI 3D Tx PHY system operation including power-up/power-down and power- on reset.

34.4.1.1 Powering Up and Powering Down

To set the HDMI_PHY in Power-down mode, set the TX_PWRON signal to 1'b0 and the PDDQ signal to 1'b1. To power up the HDMI 3D Tx PHY and place it in Active mode, set TX_PWRON to 1'b1 and PDDQ to 1'b0.

Any configuration programmed on the HDMI_PHY must be done in Power-down mode. To configure the PHY through the I^2C interface, set PHY_RESET to 1'b0 (to move the digital core from a reset state and to enable programming).

The figure below shows the power-down and power-up sequences.

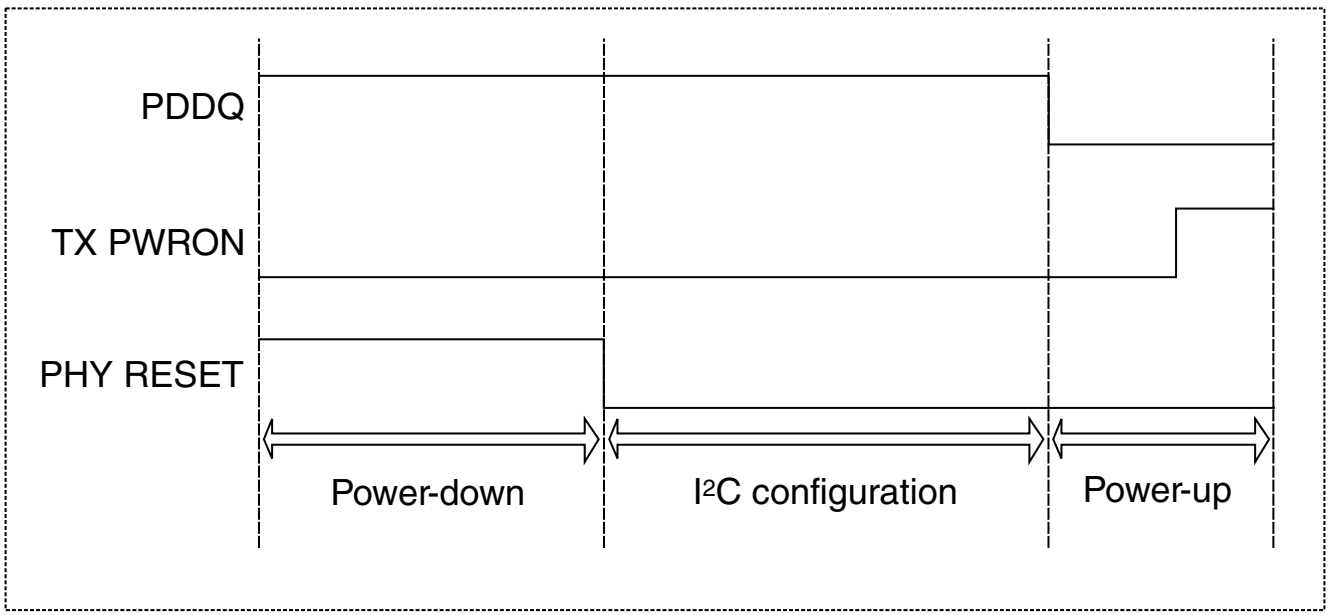

Figure 34-11. Power-Down and Power-Up Sequence

The power-up sequence starts by advancing one finite state machine (FSM) through the Phase-Locked Loop (PLL) and Multiplexed Phase-Locked Loop (MPLL) power-up states. Afterwards, resistor calibration is performed and clock alignment is enabled. When clock alignment is completed, the TX_READY signal is set to 1'b1 to indicate that the PHY is ready to transmit the TMDS clock and that data transmission and normal operation can start.

In Power-down mode, TMDS clock and data lines are disabled.

Power-Up Configuration

Before powering up the HDMI_ PHY, configure the PHY for proper operation and performance. The following PHY characteristics can be configured:

- PLL/MPLL mode of operation: Configure PLL/MPLL mode of operation as Single or Two-PLL in Coherent or Non-Coherent mode.
- PLL/MPLL clock dividers and analog configuration: Configure for each video mode.
- Driver edge rate control: Slew rate of clock and data output drivers
- Driver differential source termination: Differential source termination of clock and data output drivers
- Driver voltage level: Voltage reference level for clock and data channels
- Driver pre-emphasis: Enable and control pre-emphasis operation

For more information about this configuration and the associated control registers and signals, see Power-Up Configuration.

34.4.1.2 Active Mode Requirements

During normal operation, the RXSENSE circuitry must always be enabled (ENHPDRXSENSE asserted high).

During normal operation, if ENHPDRXSENSE is deactivated (asserted low), the PHY's analog portion is turned off.

34.4.1.3 Power-Up Requirements

Before setting the TX_PWRON signal high and the PDDQ signal low to power up the HDMI 3D Tx PHY, the PCLK and TMDSCLKIN input reference clocks must be stable and within their specified parameters, and power supply rails must be stable and within the specifications.

34.4.1.4 Power Supply Sequence When the HDMI 3D Tx PHY is Not Used

The HDMI 3D Tx PHY supports power collapsing.

There is no constraint on the power supply sequence when the HDMI 3D Tx PHY is not used. However, it is recommended that you short the data/clock lines to ground (or leave them floating). Activity at the data/clock lines or shorting the data/clock lines to the 3v3 rail (from Rx) should be avoided.

34.4.1.5 Power-Down Requirements

To enable the HDMI 3D Tx PHY to enter Power-down mode, after TX_PWRON is set to 1'b0, the PCLK input must continue toggling until the TX_READY output signal is set to 1'b0 (indicating that the PHY has been correctly set in Power-down mode). This sequence is required to enable the power-sequence machine to continue its execution and move from its states until the machine reaches the power-down state.

If this sequence is not followed, TX_READY is not set to 1'b0, and the HDMI 3D Tx PHY remains in Active mode.

34.5 Reference Clock

This chapter describes the reference clock that the HDMI_PHY supports.

The HDMI_PHY system requires an input clock signal that must be applied to the PCLK input with the following constraints:

- Minimum PCLK period/frequency (pixel repetition): 74 ns/13.5 MHz
- Minimum PCLK period/frequency (no pixel repetition): 39.7 ns/24.175 MHz
- PCLK duty cycle: 40-60%
- Maximum PCLK long-term RMS jitter: 100 ps

34.6 Control Registers

34.6.1 Control Registers Module Design Architecture

The Control Registers module is designed to provide the HDMI 3D Tx PHY with a file register component (36 words where each word comprises 16 bits).

Each register is designed to correspond to one of the following access types.

- **Read-only**: The HDMI controller can only read from this register. No writing by the HDMI controller is permitted.
- **Read/write**: The HDMI controller can read from and write to this register.
- **Read/write/override**: The HDMI controller can read from and write to this register. However, if the MSB of the register is set to 0, the value read by the HDMI controller will not be the value stored in the register; instead, the value will be the internal value of the HDMI PHY. In particular, this event occurs for 0x14, 0x18, 0x0A, and 0x0F where the value is read from the I^2C interface when PHY_RESET and TX_PWRON are low.
- **Read/write/asynchronous set-on-done**: The HDMI controller can read from and write to this register synchronously. However, three internal modules (Resistance Calibration, Clock Alignment, and Tx Scope) can write to this register asynchronously.

34.7 HDMI_PHY Memory Map/Register Definition

NOTE

HDMI_PHY registers are accessed through the I2C Master Interface of the HDMI Controller. See HDMI Transmitter (HDMI) for more information.

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–3 -	This field is reserved. Reserved
2 tx_ser_clk_kill0	Transmitter Serializer Clock Kill 0 This bit is used to delay the tx_ck_out0 sampling clock by a time t_{delay}, where t_{delay} equals one period of refclk (340 MHz). This delay equals 0.2 UI of the tx_ck_out0 clock. 0 No effect, if the Override bit is 0. 1 Delay the tx_ck_out0 clock by 0.2 UI, if the Override bit is 0.
1 tx_ser_clk_kill1	Transmitter Serializer Clock Kill 1 This bit is used to delay the tx_ck_out1 sampling clock by a time t_{delay}, where t_{delay} equals one period of refclk (340 MHz). This delay equals 0.2 UI of the tx_ck_out1 clock. 0 No effect, if the Override bit is 0. 1 Delay the tx_ck_out1 clock by 0.2 UI, if the Override bit is 0.
0 tx_ser_clk_kill2	Transmitter Serializer Clock Kill 2 This bit is used to delay the tx_ck_out2 sampling clock by a time t_{delay}, where t_{delay} equals one period of refclk (340 MHz). This delay equals 0.2 UI of the tx_ck_out2 clock. 0 No effect, if the Override bit is 0. 1 Delay the tx_ck_out2 clock by 0.2 UI, if the Override bit is 0.

34.7.5 Transmitter and Resistance Calibration Control (HDMI_PHY_TXRESCTRL)

Register name: TXRESCALCTRL

Access type: Read/write/override

Address: 0x04

Value at reset: 0x0000

Address: 0h base + 4h offset = 4h

Bit	15	14	13	12	11	10	9	8
Read Write	Override	Reserved	tx_rescal[6:0]					
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read Write	tx_ rescal[6:0]	rescal_rep[6:0]						
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_TXRESCTRL field descriptions

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14 - Reserved	This field is reserved.
13–7 tx_rescal[6:0]	Transmitter Resistance Calibration This bus controls the parallel termination of the transmitter drivers and sets termination to a value based on the calibration algorithm performed in the support resistance calibration module. tx_rescal[6:0] provides 64 termination levels; the specific values are defined from lab test results.
rescal_rep[6:0]	Resistance Calibration Replica This bus controls the bias voltage of the transmitter driver. rescal_rep[6:0] provides 64 voltage levels; the specific values are defined from lab test results.

34.7.6 Clock Calibration Control (HDMI_PHY_CKCALCTRL)

Register name: CKCALCTRL

Access type: Read/write/override

Address: 0x05

Value at reset: 0x0000

Address: 0h base + 5h offset = 5h

Bit	15	14	13	12	11	10	9	8
Read Write	Override	Reserved						
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved	ck_rescal[6:0]						
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_CKCALCTRL field descriptions

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–7 -	This field is reserved. Reserved
ck_rescal[6:0]	Clock Resistance Calibration This bus controls the termination of the clock driver and sets the termination to a value based on the calibration algorithm performed in the support resistance calibration module. ck_rescal[6:0] provides 64 termination levels; the specific values are defined from lab test results.

34.7.7 Color Depth, Pixel Repetition, Clock Divider for PLL and MPLL, and Edge Rate Control (HDMI_PHY_CPCE_CTRL)

Register name: -

Access type: Read/write

Address: 0x06

Value at reset: 0x0400

Address: 0h base + 6h offset = 6h

Bit	15	14	13	12	11	10	9	8
Read Write	Reserved	prep_div[1:0]		tx_edgerate[1:0]		ck_edgerate[1:0]		mpll_n_ cntrl[1:0]
Reset	0	0	0	0	0	1	0	0

Bit	7	6	5	4	3	2	1	0
Read Write	mpll_n_ cntrl[1:0]	pll_n_cntrl[1:0]		pixel_rep[2:0]			clr_dpth[1:0]	
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_CPCE_CTRL field descriptions

Field	Description
15 -	This field is reserved. Reserved
14–13 prep_div[1:0]	Digital Pixel Repetition Divider Controls the ratio by which the internal TMDS clock is divided to generate PREPCLK. 00 Divide by 1 (8 bit). 01 Divide by 1.25 (10 bits). 10 Divide by 1.5 (12 bits). 11 Divide by 2 (16 bits).
12–11 tx_edgerate[1:0]	Transmitter Edge Rate

Table continues on the next page...

HDMI_PHY_CPCE_CTRL field descriptions (continued)

Field	Description
	This bus controls the slew rate of the transmitter output driver. 0 tx_edgerate[0]: Slow edges 1 tx_edgerate[0]: Fast edges 0 tx_edgerate[1]: Disable edge rate override. 1 tx_edgerate[1]: Enable edge rate override.
10–9 ck_edgerate[1:0]	Clock Edge Rate This bus controls the slew rate of the clock output driver. 0 ck_edgerate[0]: Slow edges 1 ck_edgerate[0]: Fast edges 0 ck_edgerate[1]: Disable edge rate override. 1 ck_edgerate[1]: Enable edge rate override.
8–7 mpll_n_cntrl[1:0]	Programmable Divider Control This bus controls the programmable divider modulus, which are set based on the ck_ref_mpll_p/m (TMDS rate) input reference frequency to keep the ring oscillator within the required range (925 MHz through 1.85 GHz in MPLL). 00 N = 1 (for TMDS rate of 184.1-370 MHz) 01 N = 2 (for TMDS rate of 92.51-185 MHz) 10 N = 4 (for TMDS rate of 45.26-92.5 MHz) 11 N = 8 (for TMDS rate up to 45.25 MHz)
6–5 pll_n_cntrl[1:0]	Programmable Divider Control This bus controls the programmable divider modules, which are set based on the refclk_p/m (pixel rate) input reference frequency to keep the ring oscillator within the required range (740 MHz through 1.48 GHz in PLL). 00 N = 1 (for TMDS rate of 184.1-370 MHz) 01 N = 2 (for TMDS rate of 92.51-185 MHz) 10 N = 4 (for TMDS rate of 45.26-92.5 MHz) 11 N = 8 (for TMDS rate (not the pixel rate) up to 45.25 MHz)
4–2 pixel_rep[2:0]	Pixel Repetition This bus controls another factor by which to divide the input frequency (refclk) by the output TMDS rate (ck_ref_mpll_p/m). FTMDS/Fin = (clr_depth[1:0] x pixel_rep[2]) / (pixel_rep[1:0]) 0 **Pixel_rep[2]** Divide by 1. 1 **Pixel_rep[2]**Divide by 2. 00 **Pixel_rep[1:0]**Divide by 4. 01 **Pixel_rep[1:0]**Divide by 2. 1x **Pixel_rep[1:0]**Divide by 1.
clr_dpth[1:0]	Color Depth This bus controls the factor by which to divide the reference clock (PCLK) by the output TMDS rate (ck_ref_mpll_p/m). 00 Divide by 4. 01 Divide by 5.

Table continues on the next page...

HDMI_PHY_CPCE_CTRL field descriptions (continued)

Field	Description
	10 Divide by 6. 11 Divide by 8.

34.7.8 Tx and Clock Measure Control (HDMI_PHY_TXCLKMEASCTRL)

Register name: TXCKMEASCTRL

Access type: Read/write

Address: 0x07

Value at reset: 0x0000

Table 34-14. tx_meas_iv2[7:0]

Effective Bit	Register Value	Description
tx_meas_iv2[0]	00000001	Connect V_{cm_p} (common DC voltage of the positive side of scope) to the analog test bus.
tx_meas_iv2[1]	00000010	Connect V_{cm_m} (common DC voltage of the negative side of scope) to the analog test bus.
tx_meas_iv2[2]	00000100	Connect V_{bg3by4_reg} (output node of tx_vreg_vbgby2 block) to the analog test bus.
tx_meas_iv2[3]	00001000	Connect t_{x_vref} (reference voltage of tx_biasgen block) to the analog test bus.
tx_meas_iv2[4]	00010000	Connect V_{rep_fb} (feedback voltage of the replica circuit of tx_biasgen block) to the analog test bus.
tx_meas_iv2[5]	00100000	In the event that bleed current is too large, this bit can be used to force vb closer to gnd and disable/reduce the bleed current. (This bit is a debug feature, which does not pull vb to gnd properly.)
tx_meas_iv2[6]	01000000	Connect V_p (low power supply) to the analog test bus.
tx_meas_iv2[7]	10000000	Connect V_{cm} (common DC voltage of the scope) to the analog test bus.

Table 34-15. ck_meas_iv[7:0]

Effective Bit	Register Value	Description
ck_meas_iv[0]	00000001	Connect V_{cm_p} (common DC voltage of the positive side of scope) to the analog test bus.
ck_meas_iv[1]	00000010	Connect V_{cm_m} (common DC voltage of the negative side of scope) to the analog test bus.
ck_meas_iv[2]	00000100	Connect V_{bg3by4_reg} (output node of tx_vreg_vbgby2 block) to the analog test bus.

Table continues on the next page...

Table 34-15. ck_meas_iv[7:0] (continued)

ck_meas_iv[3]	00001000	Connect t_{x_vref} (reference voltage of tx_biasgen block) to the analog test bus.
ck_meas_iv[4]	00010000	Connect V_{rep_fb} (feedback voltage of the replica circuit of tx_biasgen block) to the analog test bus.
ck_meas_iv[5]	00100000	In the event that bleed current is too large, this bit can be used to force v_b closer to gnd and disable/reduce the bleed current. (This bit is a debug feature, which does not pull v_b to gnd properly.)
ck_meas_iv[6]	01000000	Connect V_p (low power supply) to the analog test bus.
ck_meas_iv[7]	10000000	Connect V_{cm} (common DC voltage of scope) to the analog test bus.

Address: 0h base + 7h offset = 7h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

HDMI_PHY_TXCLKMEASCTRL field descriptions

Field	Description
15–8 tx_meas_iv2[7:0]	Transmitter Measure Internal Voltage 2 This bus is used to test specific voltages for third transmitter lane/channel by applying voltages on the atb_sense port based on configured currents, as described in the tx_meas_iv2[7:0] table.
ck_meas_iv[7:0]	Clock Measure Internal Voltage This bus is used to test specific voltages for the clock lane/channel by applying voltages on the atb_sense port based on configured currents, as described in the ck_meas_iv[7:0] table.

34.7.9 Tx Measure Control (HDMI_PHY_TXMEASCTRL)

Register name: TXMEASCTRL

Access type: Read/write

Address: 0x08

Value at reset: 0x0000

Table 34-16. tx_meas_iv1[7:0]

Effective Bit	Register Value	Description
tx_meas_iv1[0]	00000001	Connect V_{cm_p} (common DC voltage of positive side of scope) to the analog test bus.
tx_meas_iv1[1]	00000010	Connect V_{cm_m} (common DC voltage of negative side of scope) to the analog test bus.
tx_meas_iv1[2]	00000100	Connect V_{bg3by4_reg} (output node of tx_vreg_vbgby2 block) to the analog test bus.

Table continues on the next page...

Table 34-16. tx_meas_iv1[7:0] (continued)

tx_meas_iv1[3]	00001000	Connect t_{x_vref} (reference voltage of tx_biasgen block) to the analog test bus.
tx_meas_iv1[4]	00010000	Connect V_{rep_fb} (feedback voltage of replica circuit of tx_biasgen block) to the analog test bus.
tx_meas_iv1[5]	00100000	In case bleed current is too large, this bit can be used to force v_b closer to gnd and disable/reduce the bleed current. (This bit is a debug feature, which does not pull v_b to gnd properly.)
tx_meas_iv1[6]	01000000	Connect V_p (low power supply) to the analog test bus.
tx_meas_iv1[7]	10000000	Connect V_{cm} (common DC voltage of scope) to the analog test bus.

Table 34-17. tx_meas_iv0[7:0]

Effective Bit	Register Value	Description
tx_meas_iv0[0]	00000001	Connect V_{cm_p} (common DC voltage of positive side of scope) to the analog test bus.
tx_meas_iv0[1]	00000010	Connect V_{cm_m} (common DC voltage of negative side of scope) to the analog test bus.
tx_meas_iv0[2]	00000100	Connect V_{bg3by4_reg} (output node of tx_vreg_vbgby2 block) to the analog test bus.
tx_meas_iv0[3]	00001000	Connect t_{x_vref} (reference voltage of tx_biasgen block) to the analog test bus
tx_meas_iv0[4]	00010000	Connect V_{rep_fb} (feedback voltage of replica circuit of tx_biasgen block) to the analog test bus.
tx_meas_iv0[5]	00100000	In the event that bleed current is too large, this bit can be used to force v_b closer to gnd and disable/reduce the bleed current. (This bit is a debug feature, which does not pull v_b to gnd properly.)
tx_meas_iv0[6]	01000000	Connect V_p (low power supply) to the analog test bus.
tx_meas_iv0[7]	10000000	Connect V_{cm} (common DC voltage of scope) to the analog test bus.

Address: 0h base + 8h offset = 8h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	tx_meas_iv0[7:0]								tx_meas_iv1[7:0]							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

HDMI_PHY_TXMEASCTRL field descriptions

Field	Description
15–8 tx_meas_iv0[7:0]	Transmitter Measure Internal Voltage 0 This bus is used to test specific voltages for the first transmitter lane/channel by applying voltages on the atb_sense port based on configured currents, as described in the tx_meas_iv0[7:0] table.
tx_meas_iv1[7:0]	Transmitter Measure Internal Voltage 1 This bus is used to test specific voltages for the second transmitter lane/channel by applying voltages on the atb_sense port based on configured currents, as described in the tx_meas_iv1[7:0] table.

34.7.10 Clock Symbol and Transmitter Control (HDMI_PHY_CKSYMTXCTRL)

Register name: CKSYMTXCTRL

Access type: Read/write/override

Address: 0x09

Value at reset: 0x0009

Address: 0h base + 9h offset = 9h

Bit	15	14	13	12	11	10	9	8
Read Write	Override	Reserved						
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved				tx_symon	tx_traon	tx_trbon	ck_symon
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_CKSYMTXCTRL field descriptions

Field	Description
15 Override	Writing a 0 to the override bit causes the register to set the value 0x0F, regardless of the other bit settings. Setting the override bit to 1 causes tx_symon, tx_traon, tx_trbon, and ck_symon bits to work per the register settings. These bits must be set at the same time the override bit is set to 1, or while the override bit remains at 1.
14–4 -	This field is reserved. Reserved
3 tx_symon	Transmitter Symbol On This bit enables the transmitter symbol driver(s), To enable the transmitter driver(s), the tx_pwron bit for each channel must be high. 0 Disable the transmitter symbol driver(s). 1 Enable the transmitter symbol driver(s).
2 tx_traon	Transmitter Trailer A On This bit enables the transmitter trailer A driver(s). To enable the transmitter trailer A driver(s) and to enable pre-emphasis, the tx_pwron bit for each channel must be high. 0 Disable the transmitter trailer A driver(s). 1 Enable the transmitter trailer A driver(s).
1 tx_trbon	Transmitter Trailer B On This bit enables the transmitter trailer B driver(s). To enable the transmitter trailer B driver(s) and to enable pre-emphasis, the tx_pwron bit for each channel must be high. 0 Disable the transmitter trailer B driver(s). 1 Enable the transmitter trailer B driver(s).

Table continues on the next page...

HDMI_PHY_CKSYMTXCTRL field descriptions (continued)

Field	Description
0 ck_symon	Clock Symbol On This bit enables the clock symbol driver. To enable the clock driver, the ck_powon bit must be high. In addition, there is no pre-emphasis enable for the clock driver. 0 Disable the clock symbol driver. 1 Enable the clock symbol driver.

34.7.11 Comparator Sequence Control (HDMI_PHY_CMPSEQCTRL)

Register name: CMPSEQCTRL

Access type: Read/write/override

Address: 0x0A

Value at reset: 0x0000

Address: 0h base + Ah offset = Ah

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	Override	Reserved														sup_comp_rt_r
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

HDMI_PHY_CMPSEQCTRL field descriptions

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–1 -	This field is reserved. Reserved
0 sup_comp_rt_r	Support Comparator Resistance Termination This bit controls the comparator sequence. 0 Latch the first input, if the Override bit is 0. 1 Latch the second input, then set the comparator's output pin by the result of comparison, if the Override bit is 0.

34.7.12 Comparator Power Control (HDMI_PHY_CMPPWRCTRL)

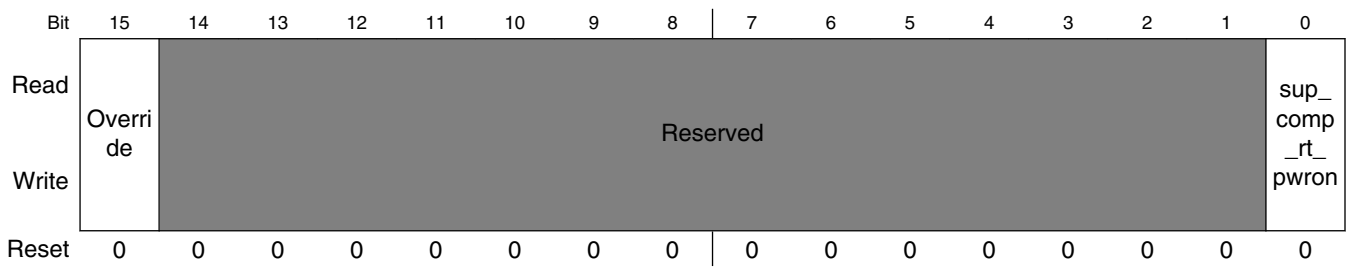
Register name: CMPPWRCTRL

Access type: Read/write/override

Address: 0x0B

Value at reset: 0x0000

Address: 0h base + Bh offset = Bh



HDMI_PHY_CMPPWRCTRL field descriptions

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–1 -	This field is reserved. Reserved
0 sup_comp_rt_pwron	Support Comparator Resistance Termination Power-On This bit powers on the Comparator module. 0 Power off the Comparator module and connect the comparator's output to ground, if the Override bit is 0. 1 Power on the Comparator module, if the Override bit is 0.

34.7.13 Comparator Mode Control (HDMI_PHY_CMPMODECTRL)

Register name: CMPMODECTRL

Access type: Read/write/override

Address: 0x0C

Value at reset: 0x0000

Address: 0h base + Ch offset = Ch

Bit	15	14	13	12	11	10	9	8
Read / Write	Override	Reserved						
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read / Write	Reserved							sup_comp_mode
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_CMPMODECTRL field descriptions

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–1 -	This field is reserved. Reserved
0 sup_comp_mode	Support Comparator Mode This bit selects the comparator mode. 0 Testing mode (ADC mode) 1 Calibration mode

34.7.14 Measure Control (HDMI_PHY_MEASCTRL)

Register name: MEASCTRL

Access type: Read/write

Address: 0x0D

Value at reset: 0x0000

NOTE

Two or more of the previous register bits must not be set to 1 simultaneously; doing so can lead to a hardware problem.

Address: 0h base + Dh offset = Dh

Bit	15	14	13	12	11	10	9	8
Read / Write	Reserved							
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read / Write	Reserved				sup_atb_on_rext	sup_por_meas_iv[1:0]		sup_dac_on_atb
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_MEASCTRL field descriptions

Field	Description
15–4 -	This field is reserved. Reserved
3 sup_atb_on_rext	Support Analog Test Bus On External Calibration Resistance This bit connects or disconnects the V_{rext} node to/from the analog test bus. 0 Disconnect the V_{rext} node from the analog test bus. 1 Connect the V_{rext} node to the analog test bus.
2–1 sup_por_meas_iv[1:0]	Support Power Measure Internal Voltage This bus connects or disconnects a single output signal on the analog test bus to measure the voltage of two nodes of the support power block. 01 Connect V_{be} (Bipolar transistor voltage) to the analog test bus. 10 Connect V_{bg} (Band-gap voltage) to the analog test bus.
0 sup_dac_on_atb	Support Digital-to-Analog Converter On Analog Test Bus This bit connects or disconnects the DAC's output on the analog test bus to test the performance of the DAC through Integral Non-Linearity (INL) and Differential Non-Linearity (DNL). 0 Disconnect the DAC's output from the analog test bus. 1 Connect the DAC's output to the analog test bus.

34.7.15 Voltage Level Control (HDMI_PHY_VLEVCTRL)

Register name: VLEVCTRL

Access type: Read/write

Address: 0x0E

Value at reset: 0x0000

Address: 0h base + Eh offset = Eh

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	Reserved						sup_tx_lvl[4:0]					sup_ck_lvl[4:0]				
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

HDMI_PHY_VLEVCTRL field descriptions

Field	Description
15–10 -	This field is reserved. Reserved
9–5 sup_tx_lvl[4:0]	Support Transmitter Level This bus controls the reference voltage level of the three transmitter channel modules. This voltage reference has a direct relation with the output signal voltage level. For more information about the driver voltage level configuration, see Appendix A: Driver Voltage Level Configuration.

Table continues on the next page...

HDMI_PHY_VLEVCTRL field descriptions (continued)

Field	Description
sup_ck_lvl[4:0]	Support Clock Level This bus controls the reference voltage level of the Clock Channel module. This voltage reference has a direct relation with the output signal voltage level. For more information about the driver voltage level configuration, see Appendix A: Driver Voltage Level Configuration.

34.7.16 Digital-to-Analog Control (HDMI_PHY_D2ACTRL)

Register name: D2ACTRL

Access type: Read/write/override

Address: 0x0F

Value at reset: 0x0000

Address: 0h base + Fh offset = Fh

Bit	15	14	13	12	11	10	9	8
Read Write	Override	Reserved				sup_dac_n[7:0]		
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read Write	sup_dac_n[7:0]					sup_dac_th_n[2:0]		
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_D2ACTRL field descriptions

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–11 -	This field is reserved. Reserved
10–3 sup_dac_n[7:0]	Support Analog-to-Digital Inverted This bus represents the LSB's of the 9-bit DAC value.
sup_dac_th_n[2:0]	Support Digital-to-Analog Thermometer Inverted This bus value is inverted and defined in the thermometer code to represent the binary code of the two MSB's of the 9-bit DAC value. **Note**: To increase the stability of the DAC block, the two MSB's of the 9-bit DAC value are represented in thermometer code, not in binary code. The MSB's of the 9-bit DAC value is split into two thermometer-code bits. A transition from 0 to 1 of the 9-bit DAC value's MSB is represented by "00" -> "01" -> "11" in thermometer code.

34.7.17 Current Control (HDMI_PHY_CURRCTRL)

Register name: CURRCTRL

Access type: Read/write

Address: 0x10

Value at reset: 0x08AB

Address: 0h base + 10h offset = 10h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	Reserved				mpll_prop_cntrl[2:0]			mpll_int_cntrl[2:0]			pll_prop_cntrl[2:0]			pll_int_cntrl[2:0]		
Reset	0	0	0	0	1	0	0	0	1	0	1	0	1	0	1	1

HDMI_PHY_CURRCTRL field descriptions

Field	Description
15–12 -	This field is reserved. Reserved
11–9 mpll_prop_ cntrl[2:0]	MPLL Proportional Control This bus controls the MPLL charge pump proportional current. Eight levels of charge pump proportional current value are possible. The specific values are defined in PLL/MPLL Generic Configuration Settings. Default (reset) value of pll_prop_cntrl[1:0] is 100.
8–6 mpll_int_cntrl[2:0]	MPLL Integral Control This bus controls the charge pump integral current. Eight levels of charge pump integral current value are possible. The specific values are defined in PLL/MPLL Generic Configuration Settings. Default (reset) value of pll_int_cntrl[1:0] is 100.
5–3 pll_prop_ cntrl[2:0]	PLL Proportional Control This bus controls the PLL charge pump proportional current. Eight levels of charge pump proportional current value are possible. The specific values are defined in PLL/MPLL Generic Configuration Settings. Default (reset) value of pll_int_cntrl is 011.
pll_int_cntrl[2:0]	PLL Charge Pump Integral Control This bus controls the PLL charge pump integral current. Eight levels of charge pump integral current value are possible. The specific values are defined in PLL/MPLL Generic Configuration Settings. Default (reset) value of pll_int_cntrl[2:0] is 100.

34.7.18 Drive Analog Control (HDMI_PHY_DRVANACTRL)

Register name: DRVANACTRL

Access type: Read/write/override

Address: 0x11

Value at reset: 0x0003

Address: 0h base + 11h offset = 11h

Bit	15	14	13	12	11	10	9	8
Read Write	Override	Reserved						
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved						pll_drv_ana	mpll_drv_ana
Reset	0	0	0	0	0	0	1	1

HDMI_PHY_DRVANACTRL field descriptions

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–2 -	This field is reserved. Reserved
1 pll_drv_ana	PLL Drive Analog This bit enables or disables driving the ck_ref_mpll_p/m clocks to the MPLL module. Default (reset) value of pll_drv_ana is 1. 0 Set ck_ref_mpll low, if the Override bit is 0. 1 Enable 25-340 MHz output clock (ck_ref_mpll_p/m) to be driven to MPLL, if the Override bit is 0.
0 mpll_drv_ana	MPLL Drive Analog This bit enables or disables driving the ck_ref_p/m clocks to all transmitters (tx_topa). Default (reset) value of mpll_drv_ana is 1. 0 Set ck_ref_p high; ck_ref_m low, if the Override bit is 0. 1 Enable ck_ref_mpll output clock (125-1700 MHz ck_ref_p/m) to be driven to all transmitters (tx_topa), if the Override bit is 0.

34.7.19 PLL Measure Control (HDMI_PHY_PLLMEASCTRL)

Register name: PLLMEASCTRL

Access type: Read/write

Address: 0x12

Value at reset: 0x0000

NOTE

With the exception of pll_atb_sense_sel and pll_meas_iv[9], two or more of the previous register bits must not be set to 1 simultaneously; doing so can lead to a hardware problem.

The table below describes the pll_meas_iv[10:0] bit settings.

Table 34-18. pll_meas_iv[10:0]

Effective Bit	Pll_meas_iv[10:0] Value	Description
Pll_meas_iv[0]	00000000001	Not used.
Pll_meas_iv[1]	00000000010	Not used in pll_top. Connected to fast_tech pins of PLL and MPLL in hdmi_topa.
Pll_meas_iv[2]	00000000100	Connects VP supply voltage to the atb_sense line.
Pll_meas_iv[3]	00000001000	Connects vp_cp to the atb_sense line.
Pll_meas_iv[4]	00000010000	Connects internal supply voltage of the VCO (ivco) to the atb_sense line.
Pll_meas_iv[5]	00000100000	Connects vp_cko voltage to the atb_sense line.
Pll_meas_iv[6]	00001000000	Connects node vpsf to the atb_sense line.
Pll_meas_iv[7]	00010000000	Connects vref to atb_sense line.
Pll_meas_iv[8]	00100000000	Connects vcntrl to atb_sense line.
Pll_meas_iv[9]	01000000000	Enables the phase mixer and pll_cko_pm_p/m.
Pll_meas_iv[10]	10000000000	Measures the voltage corresponding to the output phase of the clr_dpth divider (fb_clk) with respect to refclk.

Address: 0h base + 12h offset = 12h

Bit	15	14	13	12	11	10	9	8
Read Write	Reserved			pll_atb_ sense_sel	pll_meas_iv[10:0]			
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read Write	pll_meas_iv[10:0]							pll_meas_gd
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_PLLMEASCTRL field descriptions

Field	Description
15–13 -	This field is reserved. Reserved
12 pll_atb_sense_ sel	PLL Analog Test Bus Sense Select This bit enables or disables internal signals of the PLL to be connected to the analog test bus. Without setting this bit, no measurements can be made on the atb_sense line. Default (reset) value of pll_atb_sense_sel is 0. 0 Disable the ability to measure internal DC signals on the atb_sense line in the PLL. 1 Enable the ability to measure internal DC signals on the atb_sense line in the PLL.

Table continues on the next page...

HDMI_PHY_PLLMEASCTRL field descriptions (continued)

Field	Description
11–1 pll_meas_iv[10:0]	PLL Measure Internal Voltage This bus enables or disables measuring various PLL node voltages and branch currents. For information about the bit settings, see the pll_meas_iv[10:0] table.
0 pll_meas_gd	PLL Measure Ground This bit connects or disconnects the ground signal to the atb_sense (analog test bus) bus. 0 Disconnect the ground signal from the atb_sense bus. 1 Connect the ground signal to the atb_sense bus.

34.7.20 PLL Phase and Bypass Control (HDMI_PHY_PLLPHBYCTRL)

Register name: PLLPHBYCTRL

Access type: Read/write

Address: 0x13

Value at reset: 0x0000

Address: 0h base + 13h offset = 13h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	Reserved				bypass_ppll	pll_ph_sel_ck	pll_ph_sel[9:0]									
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

HDMI_PHY_PLLPHBYCTRL field descriptions

Field	Description
15–12 -	This field is reserved. Reserved
11 bypass_ppll	Bypass Pre-PLL This bit enables or disables bypassing the pre-PLL. 0 Disable bypassing pll_top by forcing refclk_mpll_ref low. 1 Enable bypassing pll_top by buffering refclk to refclk_mpll_ref.
10 pll_ph_sel_ck	PLL Phase Select Clock This bit enables or disables latching the ph_sel[9:0] into a 9-bit DAC used in the phase mixer.

Table continues on the next page...

HDMI_PHY_PLLPHBYCTRL field descriptions (continued)

Field	Description
	0 Disable latching the pll_ph_sel[9:0] into the 9-bit DAC. 1 Enable latching the pll_ph_sel[9:0] into the 9-bit DAC.
pll_ph_sel[9:0]	PLL Phase Select This bus is a control word for the PLL's phase mixer that enables the phase of pll_cko_pm_p/m to be varied ± 0.5 UI of the VCO frequency, which is 740-1,480 MHz.

34.7.21 Gear Shift, Reset Mode, and Power State Control (HDMI_PHY_GRP_CTRL)

Register name: -

Access type: Read/write/override

Address: 0x14

Value at reset: 0x0000

Address: 0h base + 14h offset = 14h

Bit	15	14	13	12	11	10	9	8
Read Write	Override	Reserved						
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read Write	Reserved		pll_pwr_on	pll_rst	mpll_pwr_on	mpll_rst	pll_gear_shift	mpll_gear_shift
Reset	0	0	0	0	0	0	0	0

HDMI_PHY_GRP_CTRL field descriptions

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–6 -	This field is reserved. Reserved
5 pll_pwr_on	PLL Power-On This bit is used to power on/off the PLL module. Note: If the Override bit is set to 1, the working value is the Override bit value, not the registered value. 0 Power off PLL and draw minimal current, if the Override bit is 0. 1 Power on PLL and enable it to operate normally, if the Override bit is 0.
4 pll_rst	PLL Reset This bit is used to place the MPLL in Reset mode.

Table continues on the next page...

HDMI_PHY_GRP_CTRL field descriptions (continued)

Field	Description
	0 Enable PLL to operate normally, if the Override bit is 0. 1 Place the PLL in Reset mode, if the Override bit is 0.
3 mpll_pwr_on	MPLL Power-On This bit is used to power-on/off the MPLL module. 0 Power on MPLL and set all output clocks to DC levels, if the Override bit is 0. 1 Power off MPLL and enable it to operate normally, if the Override bit is 0.
2 mpll_rst	MPLL Reset This bit is used to place the MPLL in Reset mode. 0 Enable MPLL to operate normally, if the Override bit is 0. 1 Place the MPLL in Reset mode, if the Override bit is 0.
1 pll_gear_shift	PLL Gear Shift This bit enables or disables Rapid Locking mode, where the pll_gear_shift bit is asserted for 25 µs when coming out of reset, then deasserted before clocks are valid. 0 Disable Rapid Locking mode, if the Override bit is 0. 1 Enable Rapid Locking mode, if the Override bit is 0.
0 mpll_gear_shift	MPLL Gear Shift This bit enables or disables Rapid Locking mode, where the mpll_gear_shift bit is asserted for 25 µs when coming out of reset, then deasserted before clocks are valid. 0 Disable Rapid Locking mode, if the Override bit is 0. 1 Enable Rapid Locking mode, if the Override bit is 0.

34.7.22 Gmp Control (HDMI_PHY_GMPCTRL)

Register name: GMPCTRL

Access type: Read/write

Address: 0x15

Value at reset: 0x0000

Address: 0h base + 15h offset = 15h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	Reserved												pll_gmp_cntrl[1:0]		mpll_gmp_cntrl[1:0]	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

HDMI_PHY_GMPCTRL field descriptions

Field	Description
15–4 -	This field is reserved. Reserved
3–2 pll_gmp_cntrl[1:0]	PLL gmp Control This bus controls the effective loop-filter resistance (equal) to increase or decrease PLL bandwidth and to compensate for changes in the Divider module (n_cntrl). 00 TMDS rate up to 45.25 MHz 01 TMDS rate of 45.26-92.5 MHz 10 TMDS rate of 92.51-185 MHz 11 TMDS rate of 184.1-370 MHz
mpll_gmp_ cntrl[1:0]	MPLL gmp Control This bus controls the effective loop-filter resistance (= 1/gmp) to increase or decrease MPLL bandwidth and to compensate for changes in the Divider module (n_cntrl). 00 TMDS rate up to 45.25 MHz 01 TMDS rate of 45.26-92.5 MHz 10 TMDS rate of 92.51-185 MHz 11 TMDS rate of 184.1-370 MHz

34.7.23 MPLL Measure Control (HDMI_PHY_MPLLMEASCTRL)

Register name: MPLLMEASCTRL

Access type: Read/write

Address: 0x16

Value at reset: 0x0000

NOTE

With the exception of mpll_atb_sense_sel, mpll_meas_iv[9], and mpll_meas_iv[11], two or more of the previous register bits must not be set to 1 simultaneously, because doing so can lead to a hardware problem.

The table below describes the mpll_meas_iv[11:0] bit settings.

Table 34-19. mpll_meas_iv[11:0]

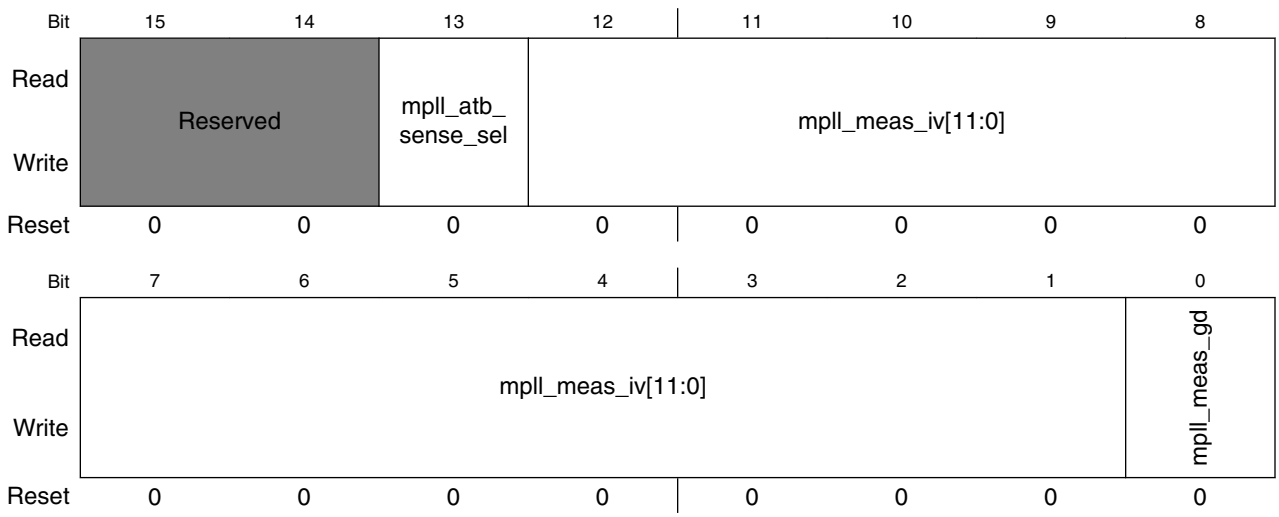
Effective Bit	mpll_meas_iv[11:0] Value	Description
mpll_meas_iv[0]	000000000001	Connects the internal positive DCC control line (vc0p) to the atb_sense line.
mpll_meas_iv[1]	000000000010	Connects the internal negative DCC control line (vc0m) to the atb_sense line.

Table continues on the next page...

Table 34-19. mpll_meas_iv[11:0] (continued)

Effective Bit	mpll_meas_iv[11:0] Value	Description
mpll_meas_iv[2]	000000000100	Connects VP supply voltage to the atb_sense line.
mpll_meas_iv[3]	000000001000	Connects vp_cp to the atb_sense line.
mpll_meas_iv[4]	000000010000	Connects the internal supply voltage of the VCO (ivco) to the atb_sense line through a low-pass filter.
mpll_meas_iv[5]	000000100000	Connects the vp_cko voltage to the atb_sense line.
mpll_meas_iv[6]	000001000000	Connects the vpsf node to the atb_sense line.
mpll_meas_iv[7]	000010000000	Connects vref to the atb_sense line.
mpll_meas_iv[8]	000100000000	Connects vcntrl to the atb_sense line.
mpll_meas_iv[9]	001000000000	Enables the phase mixer and cko_pm_p/m.
mpll_meas_iv[10]	010000000000	Measures the voltage corresponding to the phase of the divide-by-5 output (fb_clk) with respect to the phase of the mpll_ana input (ck_refclk_p).
mpll_meas_iv[11]	100000000000	Forces div_x1 low; therefore, bitclk_p/m is multiplexed to ck_ref_p/m (normally, if n_cntrl = 00, ck0_p/m is multiplexed to ck_ref_p/m and DCC loop is enabled.

Address: 0h base + 16h offset = 16h



HDMI_PHY_MPLLMEASCTRL field descriptions

Field	Description
15–14 -	This field is reserved. Reserved
13 mpll_atb_sense_ sel	MPLL Analog Test Bus Sense Select This bit enables or disables internal signals of the PLL to be connected to the analog test bus. Without setting this bit, no measurements can be made on the atb_sense line. Default (reset) value of mpll_atb_sense_sel is 0. 0 Disable the ability to measure internal DC signals on the atb_sense line in the PLL. 1 Enable the ability to measure internal DC signals on the atb_sense line in the PLL.

Table continues on the next page...

HDMI_PHY_MPLLMEASCTRL field descriptions (continued)

Field	Description
12–1 mpll_meas_iv[11:0]	MPLL Measure Internal Voltage This bus enables or disables measuring various PLL node voltages and branch currents. For information about the bit settings, see the mpll_meas_iv[11:0] table.
0 mpll_meas_gd	MPLL Measure Ground This bit connects or disconnects the ground signal to the atb_sense (analog test bus) bus. 0 Disconnect the ground signal from the atb_sense bus. 1 Connect the ground signal to the atb_sense bus.

34.7.24 MPLL and PLL Phase, Scope Clock Select, and MUX Clock Control (HDMI_PHY_MSM_CTRL)

Register name: -

Access type: Read/write

Address: 0x17

Value at reset: 0x0000

The table below describes the cko_sel[1:0] bit settings. (The cko_sel[1:0] default value is 00.)

Table 34-20. cko_sel[1:0]

cko_sel[1:0]	TMDS Clock Mode	PLL and MPLL Mode	Output TMDS Clock on TMDS Channel
00	Non-Coherent	Normal	ck_ref_mpll_p/m (Pre-PLL out)
01	Off (PLL and MPLL are both off)	Normal	Off (No output TMDS clock)
10	Test (PHY in test mode)	Normal	PCLK (Input reference clock to HDMI 3D Tx PHY)
11	Coherent	Normal	fb_clk (MPLL feedback clock)
00	Off (PLL and MPLL are both off)	Bypass	Off (No output TMDS clock)
01	Off (PLL and MPLL are both off)	Bypass	Off (No output TMDS clock)
10	Non-Coherent	Bypass	PCLK (Input reference clock to HDMI 3D Tx PHY)
11	Coherent	Bypass	fb_clk (MPLL feedback clock)

Address: 0h base + 17h offset = 17h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	Reserved		mpll_ph_sel_ck	mpll_ph_sel[9:0]										cko_sel[1:0]		scope_ck_sel
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

HDMI_PHY_MSM_CTRL field descriptions

Field	Description
15–14 -	This field is reserved. Reserved
13 mpll_ph_sel_ck	MPLL Phase Select Clock This bit enables or disables latching ph_sel[9:0] into a 9-bit DAC used in the phase mixer. 0 Disable latching mpll_ph_sel[9:0] into the 9-bit DAC. 1 Enable latching mpll_ph_sel[9:0] into the 9-bit DAC.
12–3 mpll_ph_sel[9:0]	MPLL Phase Select This bus is a control word for the MPLL's phase mixer and enables the phase of pll_cko_pm_p /m to be varied ± 0.5 UI of the VCO frequency, which has a range of 925-1,850 MHz.
2–1 cko_sel[1:0]	Clock Output Select This bus selects the clock to be connected to the output TMDS clock channel. **Notes:** • Normal mode: The color depth or pixel repetition is required, which means that the PLL is powered on (pll_pwr_on bit is set to 1) and the bypass_ppll bit is set to 0. • Bypass mode: The color depth and the pixel repetition is not required, which means that the PLL is powered off (pll_pwr_on bit is set to 0) and the bypass_ppll bit is set to 1. For information about the cko_sel[1:0] bit settings and corresponding PLL/MPLL modes, see the cko_sel[1:0] table.
0 scope_ck_sel	Scope Clock Select Selects the clock to connect to the scope clock signal: the differential pll_cko_p/m or the differential mpll_cko_p/m. 0 Connect the mpll_cko_pm_p/m to the clock scope (this clock has a range of 23.125-45.25 MHz) where the mpll_meas_iv[9] bit must be high. 1 Connect the pll_cko_pm_p/m to the clock scope (this clock has a range of 23.125-45.25 MHz) where the pll_meas_iv[9] bit must be high.

34.7.25 Scope, Comparator Result and Power Bad Status (HDMI_PHY_SCRPB_STATUS)

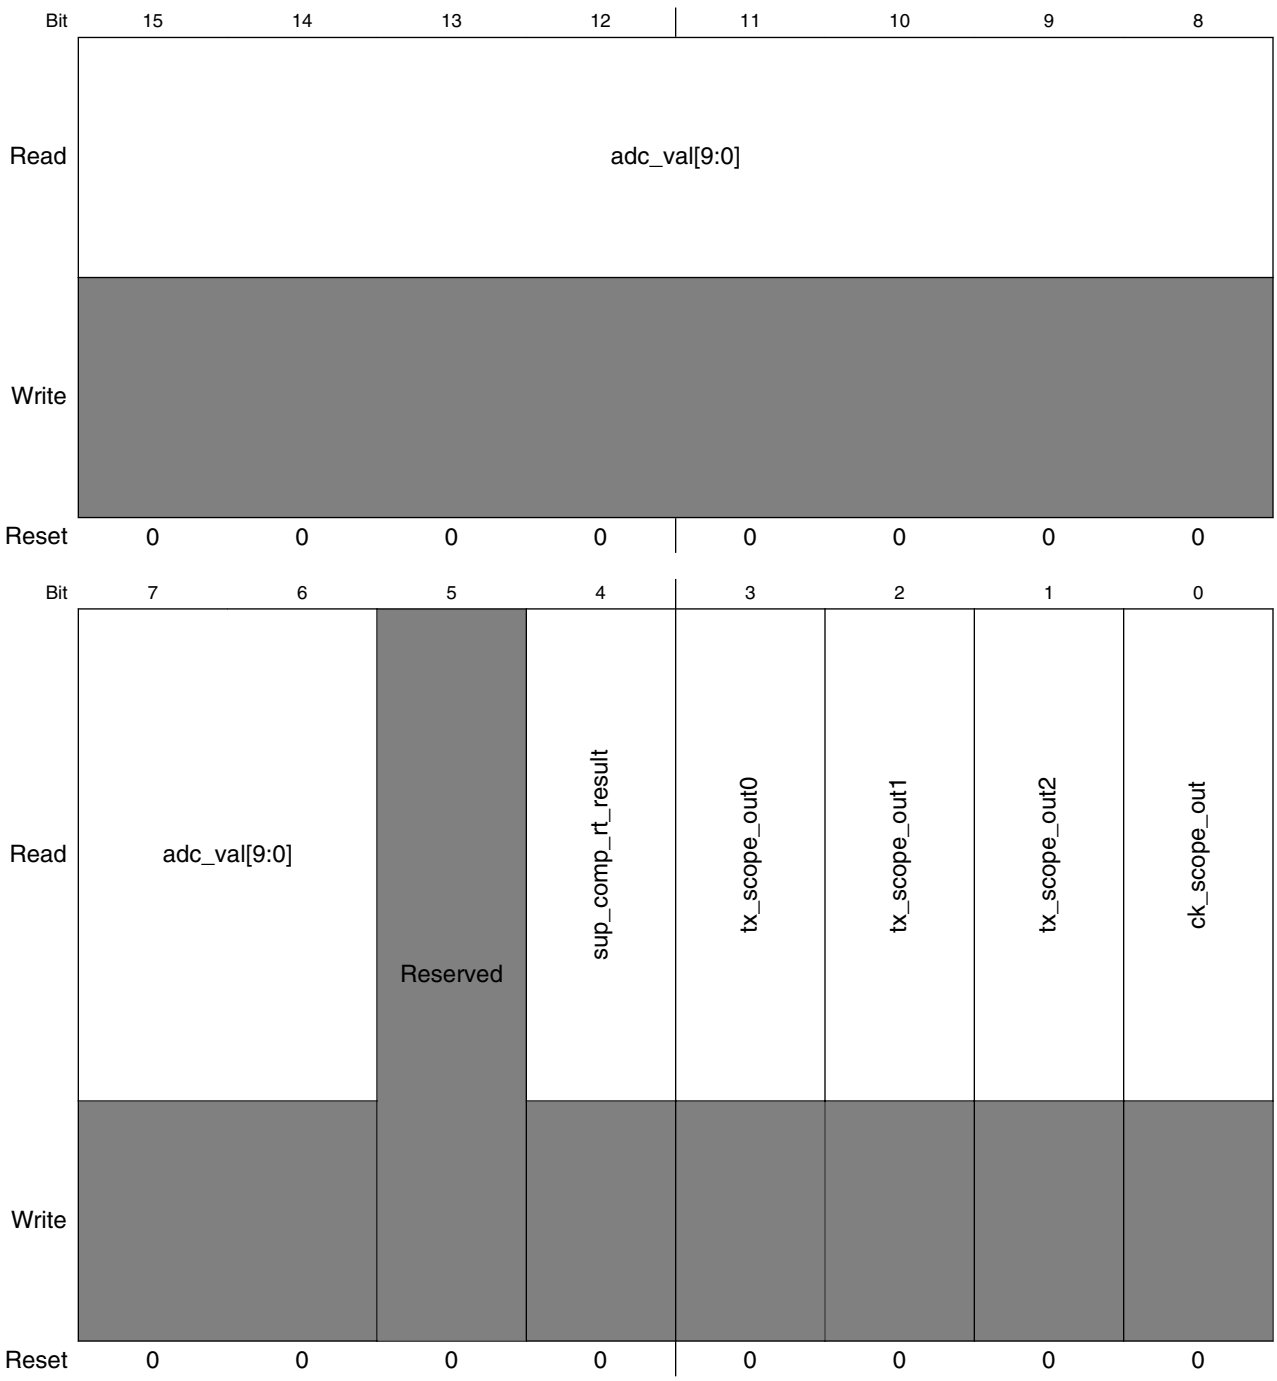
Register name: -

Access type: Read-only

Address: 0x18

Value at reset: N/A

Address: 0h base + 18h offset = 18h



HDMI_PHY_SCRPB_STATUS field descriptions

Field	Description
15–6 adc_val[9:0]	ADC/DAC bit word (analog signal value)
5 -	This field is reserved. Reserved
4 sup_comp_rt_result	Support Comparator Resistance Termination Result This bit represents the result of the comparison process. 0 The first input is greater than or equal to the second input. 1 The first input is less than the second input.
3 tx_scope_out0	Scoping Value for Lane 0 0 The driver output of lane 0 is not differential. 1 The driver output of lane 0 is differential.
2 tx_scope_out1	Scoping Value for Lane 1 0 The driver output of lane 1 is not differential. 1 The driver output of lane 1 is differential.
1 tx_scope_out2	Scoping Value for Lane 2 0 The driver output of lane 2 is not differential. 1 The driver output of lane 2 is differential.
0 ck_scope_out	Clock Scope Output Signal 0 The clock driver output is not differential. 1 The clock driver output is differential.

34.7.26 Transmission Termination (HDMI_PHY_TXTERM)

Register name: TXTERM

Access type: Read/write

Address: 0x19

Value at reset: 0x0007

Address: 0h base + 19h offset = 19h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table continues on the next page...

HDMI_PHY_SDCAP_MODE field descriptions (continued)

Field	Description
	101 Enable the Pattern Generator module and generate a sequence of patterns for the third channel with fixed pattern using word of 0's word, 1's word, random word, the saved pattern inside the pg_pat[9:0] field of the PATTERNGEN register, and the inverted pg_pat[9:0] values (for example, 9 bits of 0's, 9 bits of 1's, 3FF, pg_pat[9:0], ~ pg_pat[9:0]). 110 Reserved 111 Reserved
8–6 pg_mode1[2:0]	Pattern Generator Mode 1 This bus is used to select the mode of the Pattern Generator module for channel 1. 000 Disable the Pattern Generator module. 001 Enable the Pattern Generator module and generate a sequence of patterns for the second channel using LFSR 15 equation (for example, x15 + x14 + 1). 010 second the Pattern Generator module and generate a sequence of patterns for the first channel using LFSR 7 equation (for example, x7 + x6 + 1). 011 Enable the Pattern Generator module and generate a sequence of patterns for the second channel with the fixed word, which is saved inside the pg_pat[9:0] field of the PATTERNGEN register. 100 Enable the Pattern Generator module and generate a sequence of patterns for the second channel with DC-balanced word (for example, 0's or 1's and their inverted values). 101 Enable the Pattern Generator module and generate a sequence of patterns for the second channel with fixed pattern using word of 0's word, 1's word, random word, the saved pattern inside the pg_pat[9:0] field of the PATTERNGEN register, and the inverted pg_pat[9:0] values (for example, 9 bits of 0's, 9 bits of 1's, 3FF, pg_pat[9:0], ~ pg_pat[9:0]). 110 Reserved 111 Reserved
5–3 pg_mode0[2:0]	Pattern Generator Mode 0 This bus is used to select the mode of the Pattern Generator module for channel 0. 000 Disable the Pattern Generator module. 001 Enable the Pattern Generator module and generate a sequence of patterns for the first channel using LFSR 15 equation (for example, x15 + x14 + 1). 010 Enable the Pattern Generator module and generate a sequence of patterns for the first channel using LFSR 7 equation (for example, x7 + x6 + 1). 011 Enable the Pattern Generator module and generate a sequence of patterns for the first channel with the fixed word, which is saved inside the pg_pat[9:0] field of the PATTERNGEN register. 100 Enable the Pattern Generator module and generate a sequence of patterns for the first channel with DC-balanced word (for example, 0's or 1's and their inverted values). 101 Enable the Pattern Generator module and generate a sequence of patterns for the first channel with fixed pattern using word of 0's word, 1's word, random word, the saved pattern inside the pg_pat[9:0] field of the PATTERNGEN register, and the inverted pg_pat[9:0] values (for example, 9 bits of 0's, 9 bits of 1's, 3FF, pg_pat[9:0], ~ pg_pat[9:0]). 110 Reserved 111 Reserved
2 tx_ck_align_mode	Transmission Clock Alignment Mode This bit selects the Transmission Clock Alignment mode. 0 Align the three lanes based on lane 1. 1 Align each of the three lanes separately in the following order: lane 2, lane 0, then lane 1.
1 adc_enb	Analog-to-Digital Converter Enable This bit enables or disables the analog-to-digital converter.

Table continues on the next page...

HDMI_PHY_SDCAP_MODE field descriptions (continued)

Field	Description
	0 Disable the analog-to-digital converter. 1 Enable the analog-to-digital converter, which is used in the Resistance Calibration module.
0 soft_reset	Soft Reset This bit enables or disables the soft-reset feature. 0 Do not perform a soft reset. 1 Perform a soft reset by resetting all the system FSMs except the I^2C and Control Register modules.

34.7.30 Scope Mode register (HDMI_PHY_SCOPEMODE)

Register name: SCOPEMODE

Access type: Read/write

Address: 0x1D

Value at reset: 0x0000

Address: 0h base + 1Dh offset = 1Dh

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	Reserved		ck_scope_enb	scope_enb2	scope_enb1	scope_enb0	scope_sample_cnt[9:0]									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

HDMI_PHY_SCOPEMODE field descriptions

Field	Description
15–14 -	This field is reserved. Reserved
13 ck_scope_enb	Clock Scope Enable This bit enables or disables the tracing of 1's on the clock channel. 0 Disable the tracing of 1's on the clock. 1 Enable the tracing of 1's on the clock.
12 scope_enb2	Scope Enable 2 This bit enables or disables the tracing of 1's on channel 2. 0 Disable the tracing of 1's on the third channel. 1 Enable the tracing of 1's on the third channel.
11 scope_enb1	Scope Enable 1 This bit enables or disables the tracing of 1's on channel 1.

Table continues on the next page...

HDMI_PHY_SCOPEMODE field descriptions (continued)

Field	Description
	0 Disable the tracing of 1's on the second channel. 1 Enable the tracing of 1's on the second channel.
10 scope_enb0	Scope Enable 0 This bit enables or disables the tracing of 1's on channel 0. 0 Disable the tracing of 1's on the first channel. 1 Enable the tracing of 1's on the first channel.
scope_sample_cnt[9:0]	Scope Sample Counter Indicates the number of samples that will be counted (should be multiple of the LFSR length). This count includes only the LSB bits; if the LFSR15 was used, you must program the new bits under the 0x24 register.

34.7.31 Digital Transmission Mode (HDMI_PHY_DIGTXMODE)

Register name: DIGTXMODE

Access type: Read/write

Address: 0x1E

Value at reset: 0x0000

dtb_select[6:0]

The dtb_select[6:0] encodings for the bit pairs are as follows:

HDMI_PHY_SCOPECNTMSB2CK field descriptions

Field	Description
15–13 - Reserved	This field is reserved.
12–6 ck_scope_ones_cnt[21:16]	Clock Scope 1's Counter This register carries the number of counted 1's on the clock channel. These 1's are the MSB bits only.
scope_ones_cnt2[21:16]	Scope 1's Counter 2 This register carries the number of counted 1's on channel 2. These 1's are the MSB bits only.

34.8 Appendix A: Driver Voltage Level Configuration

This appendix describes the driver voltage level configuration.

This configuration depends on the source termination value, the driver pre-emphasis settings, and the target signal voltage level swing.

A correct configuration must be set to meet both eye diagram mask and the specified high and low signal voltage levels.

To correctly configure the driver voltage level, the following parameters and signals (represented through their symbol) must be taken into consideration:

- VPH_{RXTERM} = 3.3 V -> 3.3-V supply rail connected to HDMI PHY sink termination resistors
- RXTERM = 50 Ω -> HDMI PHY sink termination resistors

Control Register	Signal	Symbol
0x19	d_tx_temp[2:0]	RTERM
0x0E	sup_tx_lvl[4.:0]	TXLVL
0x0E	sup_ck_lvl[4.:0]	CKLVL
0x09	tx_symon	SYMON
0x09	tx_traon	TRAON
0x09	tx_trbon	TRBON

The following table defines the pre-emphasis factor (PREEMPH) to be used in the information that follows.

SYMON	TRAON	TRBON	PREEMPH
0	0	0	-
1	0	0	0.00
1	0	1	0.08
1	1	0	0.17
1	1	1	0.25

The following equations can be used to calculate-for a certain signal voltage swing (VSWING) and PHY configuration (PREEMPH, RTERM)-the signal's high and low voltage levels (VHI, VLO).

VHI = VLO + VSWING

TXLVL = CKLVL = [0.772 - (VPHRXTERM - VLO)] / 0.01405

For a certain termination value and pre-emphasis configuration (factor), users input only the VSWING value. With this data, users can obtain the respective VHI and VLO DC levels and the TXLVL and CKLVL configuration to apply to the PHY.

Lower TXLVL/CKLVL values result in higher signal amplitudes, while higher TXLVL/CKLVL values result in lower signal amplitudes.

Values for VSWING, VHI, and VLO must be within HDMI 1.4a specification limits. The table below provides driver voltage level settings for some example scenarios.

Table 34-21. Example Driver Voltage Level Settings

RTERM	SYMON	TRAON	TRBON	VHI (V)	VLO (V)	VSWING (V)	TXLVL	TXLVL (BIN)	CKLVL	CKLVL (BIN)

34.9 Appendix B

This appendix describes the PLL/MPLL configurations that must be made for each video mode of operation.

The PLL/MPLL configurations are divided in two distinct sections. Power-Up Requirements describes how to configure the PLL/MPLL mode of operation, and PLL/MPLL Generic Configuration Settings describes all the settings required to configure the PLL/MPLL for each specific video mode.

34.9.1 Single or Two-PLL in Coherent or Non-Coherent Mode of Operation

Table 34-22. Single or Two-PLL in Coherent or Non-Coherent Mode of Operation

Mode of Operation	bypass_ppll Register address: 0013: Bit 11	cko_sel<1> Register address: 0017: Bit 2	cko_sel<0> Register address: 0017: Bit 1
Two-PLL Non-Coherent (default)	0	0	0
Two-PLL Coherent	0	1	1
Single-PLL Non-Coherent	1	1	0
Single-PLL Coherent	1	1	1

NOTE

Single-PLL Coherent and Non-Coherent modes can be set for only video formats with no pixel repetition and color depth equal to 8 bits.

34.9.2 PLL/MPLL Generic Configuration Settings

Each supported video format can be referred to by its input pixel clock frequency, pixel repetition, and color depth in bits.

The table beblow provides all the PLL/MPLL settings necessary to completely configure the blocks for any supported video format.

34.10 Appendix C: 3D Video Formats

3D video formats are created from any of the supported VICs. The 3D structure in which the frames are organized determines the way data is transferred.

The 3D video format is indicated using the VIC in the AVI InfoFrame (indicating one of the 2D formats defined in the CEA-861-D standard) in conjunction with the 3D_Structure field in the HDMI vendor-specific InfoFrame.

For Side-by-Side (Half) and Top-and-Bottom 3D structures, pixel clock frequency is equal to the original VIC pixel clock frequency.

For the L+depth+GFX+GFX-depth 3D structure, pixel clock frequency is equal to 4x the original VIC pixel clock frequency.

For other 3D structures, pixel clock frequency is equal to 2x the original VIC pixel clock frequency.

The following table summarizes the original 2D VIC pixel clock frequencies required to support the 3D structures.

Table 34-24. 2D VIC Pixel Clock Frequencies Required to Support 3D Structures

3D Structure	2D Pixel Clock Frequency
0000 (Frame Packing)	2x 2D pixel clock frequency
0001 (Field alternative)	2x 2D pixel clock frequency
0010 (Line alternative)	2x 2D pixel clock frequency
0011 (Side-by-Side (Full))	2x 2D pixel clock frequency
0100 (L + depth)	2x 2D pixel clock frequency
0101 (L + depth + GPX + GFX-depth)	4x 2D pixel clock frequency
0110 (Top-and-Bottom)	2D pixel clock frequency
1000 (Side-by-Side (Half))	2D pixel clock frequency

VIC-specific PLL/MPLL configurations apply to Side-by-Side (Half) and Top-and-Bottom 3D structures. To obtain the PLL/MPLL configuration for a specific VIC used within a 3D structure, see PLL/MPLL Generic Configuration Settings. Each configuration corresponds to a specific video format's pixel clock, pixel repetition, and color depth combination.

Example:

VIC 32: No pixel repetition, PCLK = 74.25 MHz, CD = 8,10,12,16

VIC 32 within 3D structure:

- Side-by-Side (Half) 3D structure (same pixel clock frequency): Same PLL/MPLL configuration as for VIC 32.
- Frame Packing (doubled pixel clock frequency): PLL/MPLL configuration corresponds to a row in Table 34-23 with the following: no pixel repetition, PCLK = 148.5 MHz, CD = 8,10,12,16.

For VICs where PCLK = 148.5 MHz, no color depth is supported for 3D video format, because the pixel clock frequency would be greater than 340 MHz.

Table 34-25 provides examples of primary 3D video format timings, and Table 34-26 provides examples of other 3D video format timings. Secondary 3D video format timings can be found in the HDMI specification.

Table 34-25. Primary 3D Video Format Timings

VIC	Video	Vertical Refresh Rate (Hz)	2D Pixel Clock (MHz)	3D Structure	3D Pixel Clock (MHz)

Chapter 35
I2C Controller (I2C)

35.1 Overview

This chapter describes block-level operation and programming of I2C. The chapter is intended for a block-driver software developer. To understand how the block is integrated at the SoC level, a system software developer should see discussions of the block in the appropriate SoC-level chapter(s).

References: This document assumes an understanding of the following document:

- *The I2C Bus Specification*, Version 2.1, by Philips Semiconductor

The Inter IC (I2C) provides functionality of a standard I2C slave and master. The I2C is designed to be compatible with the standard NXP I2C bus protocol.

NOTE

Three independent I2C channels are available.

I2C is a two-wire, bidirectional serial bus that provides a simple, efficient method of data exchange, minimizing the interconnection between devices. This bus is suitable for applications requiring occasional communications over a short distance between many devices. The flexible I2C standard allows additional devices to be connected to the bus for expansion and system development. See the connection diagram in the figure below.

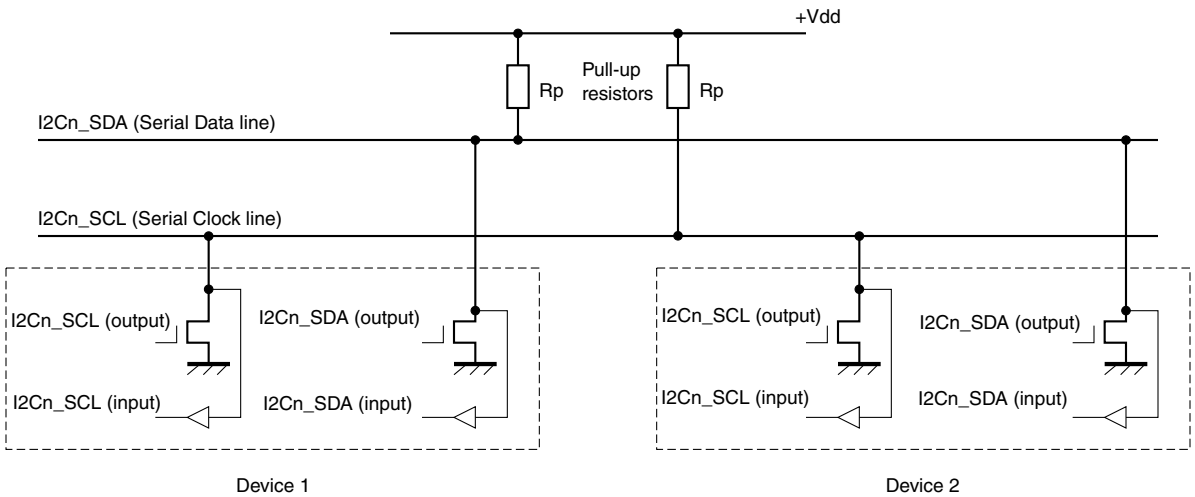

Figure 35-1. Connection of devices to I2C bus

The I2C interface speed is dependent on the I2C bus loading and timing characteristics. For pin requirement details, see *The I2C Bus Specification*. The I2C system is a true multimaster bus including arbitration and collision detection that prevents data corruption if multiple devices attempt to control the bus simultaneously. This feature supports complex applications with multiprocessor control and can be used for rapid testing and alignment of end products through external connections to an assembly-line computer. The figure below shows the block diagram of I2C.

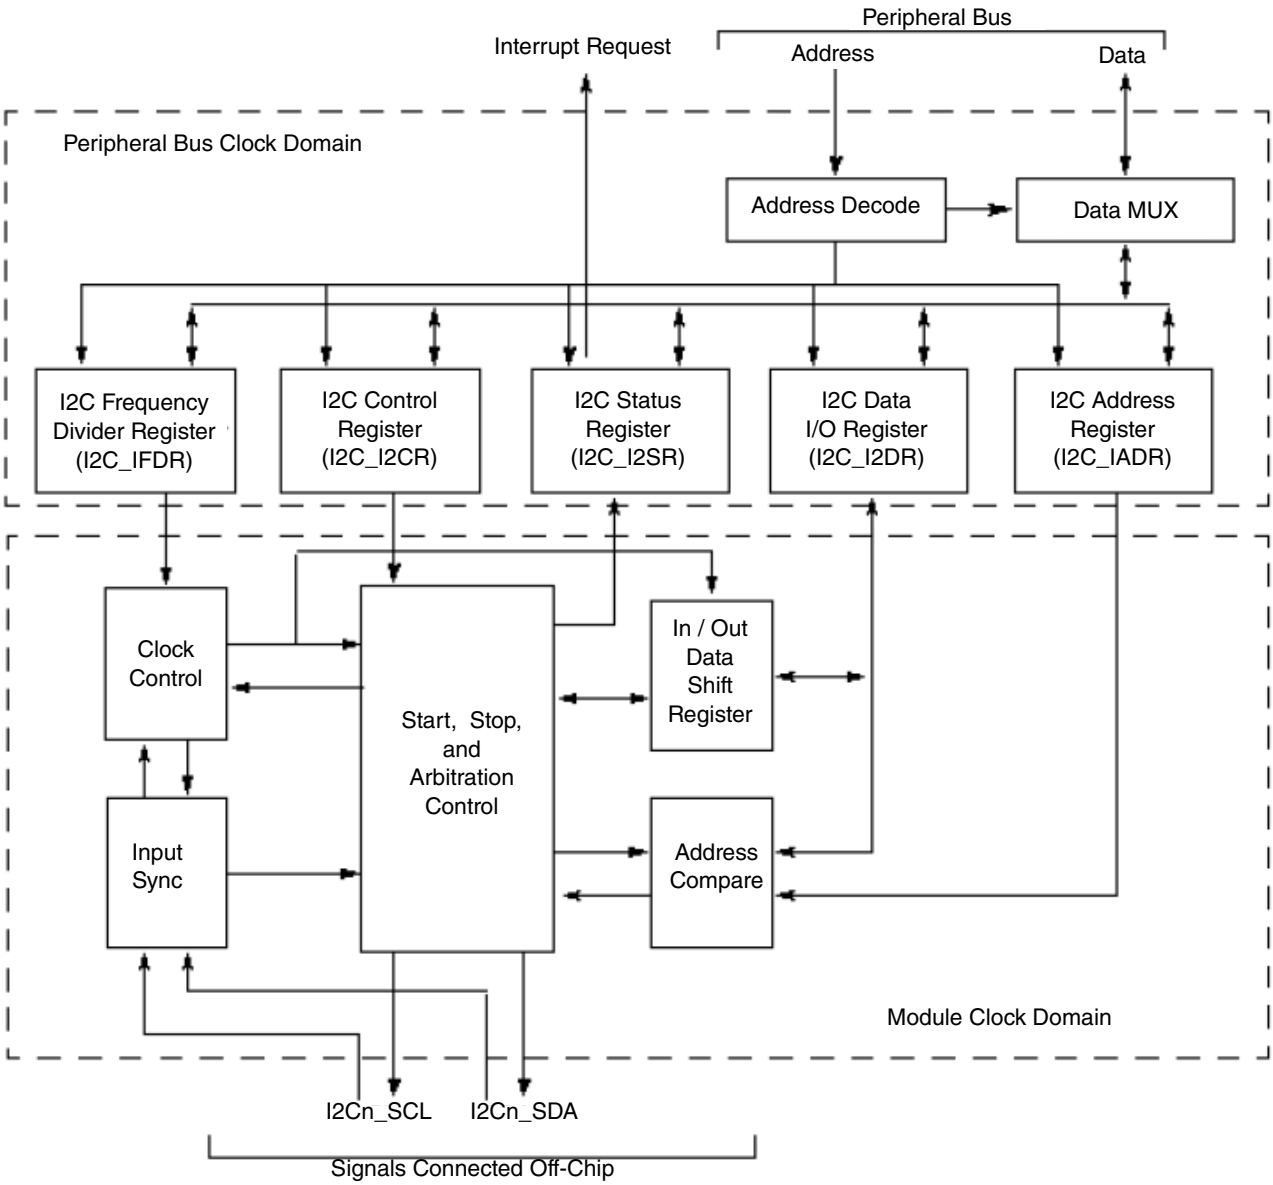

Figure 35-2. I2C block diagram

35.1.1 Features

The I2C has the following key features:

- Compatibility with I2C bus standard
- Multimaster operation
- Software programmability for one of 64 different serial clock frequencies
- Software-selectable acknowledge bit
- Interrupt-driven, byte-by-byte data transfer
- Arbitration-lost interrupt with automatic mode switching from master to slave

- Calling address identification interrupt
- Start and stop signal generation/detection
- Repeated Start signal generation
- Acknowledge bit generation/detection
- Bus-busy detection

35.1.2 Modes and operations

The I2C operates primarily in two functional modes: Standard mode and Fast mode.

- In Standard mode, I2C supports the data transfer rates up to 100 kbits/s.
- In Fast mode, data transfer rates up to 400 kbits/s can be achieved. Per block operation, there is no special configuration required for Fast or Standard mode. It is the data transfer rate that distinguishes Standard and Fast mode.

35.2 External Signals

This section discusses I2C signals that connect off-chip.

For I2C compliance, all devices connected to the I2Cn_SCL and I2Cn_SDA signals must have open-drain or open-collector outputs. The logic AND function is implemented on both lines with external pull-up resistors.

Inputs of I2Cn_SCL and I2Cn_SDA also need to be manually enabled by setting the SION bit in the IOMUX after the corresponding PADs are selected as I2C function.

The table below describes all I2C signals that connect off-chip.

Table 35-1. I2C External Signals

Signal	Description	Pad	Mode	Direction
I2C1_SCL (SCL)	Serial Clock	CSI0_DAT9	ALT4	IO
		EIM_D21	ALT6	
I2C1_SDA (SDA)	Serial Data	CSI0_DAT8	ALT4	IO
		EIM_D28	ALT1	
I2C2_SCL (SCL)	Serial Clock	EIM_EB2	ALT6	IO
		KEY_COL3	ALT4	
I2C2_SDA (SDA)	Serial Data	EIM_D16	ALT6	IO
		KEY_ROW3	ALT4	
I2C3_SCL (SCL)	Serial Clock	EIM_D17	ALT6	IO
		GPIO_3	ALT2	

Table continues on the next page...

Table 35-1. I2C External Signals (continued)

Signal	Description	Pad	Mode	Direction
		GPIO_5	ALT6	
I2C3_SDA (SDA)	Serial Data	EIM_D18	ALT6	IO
		GPIO_6	ALT2	
		GPIO_16	ALT6	

35.3 Clocks

There are two input clocks for I2C.

The following table describes the clock sources for I2C. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 35-2. I2C Clocks

Clock name	Clock Root	Description
ipg_clk_patref	perclk_clk_root	Module clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- Peripheral clock (ipg_clk_s): This clock is used for peripheral bus register read/ writes.
- Module clock (ipg_clk_patref): This is the functional clock of the I2C. The serial bit clock frequency is derived from the module clock. The module clock and peripheral clocks are synchronous with each other. The minimum frequency of the module clock should be 12.8 MHz for Fast mode to achieve 400-kbps operation.

35.4 Functional description

This section provides a complete functional description of the block.

35.4.1 I2C system configuration

After a reset, the I2C defaults to Slave Receive operations. Thus, when not operating as a master or responding to a slave transmit address, the I2C defaults to the Slave Receive state.

For exceptions, see Initialization sequence.

NOTE

The I2C is designed to be compatible with the Philips™ I2C bus protocol. For information on system configuration, protocol, and restrictions, see the *I2C Bus Specification*, version 2.1, by Philips Semiconductors. The I2C supports Standard and Fast modes only.

35.4.2 Arbitration procedure

If multiple devices simultaneously request the bus, the bus clock is determined by a synchronization procedure in which the low period equals the longest clock-low period among the devices, and the high period equals the shortest. A data arbitration procedure determines the relative priority of competing devices.

A device loses arbitration if it sends logic high while another sends logic low; it immediately switches to Slave Receive mode and stops driving I2Cn_SDA. In this case, the transition from master to Slave mode does not generate a Stop condition. Meanwhile, hardware sets the arbitration lost bit in the I2C Status register (I2C_I2SR[IAL] to indicate loss of arbitration).

35.4.3 Clock synchronization

Because wire-AND logic is used, a high-to-low transition on SCL affects devices connected to the bus. Devices start counting their low period when the master drives SCL low. When a device clock goes low, it holds SCL low until the Clock High state is reached. However, the low-to-high change in this device clock may not change the state of SCL if another device clock is still in its low period. Therefore, the device with the longest low period holds the synchronized clock SCL low.

Devices with shorter low periods enter a High Wait state during this time (see Figure 35-3). When all devices involved have counted off their low periods, the synchronized clock SCL is released and pulled high. There is then no difference between device clocks and the state of SCL, so all of the devices start counting their high periods. The first device to complete its high period pulls SCL low again.

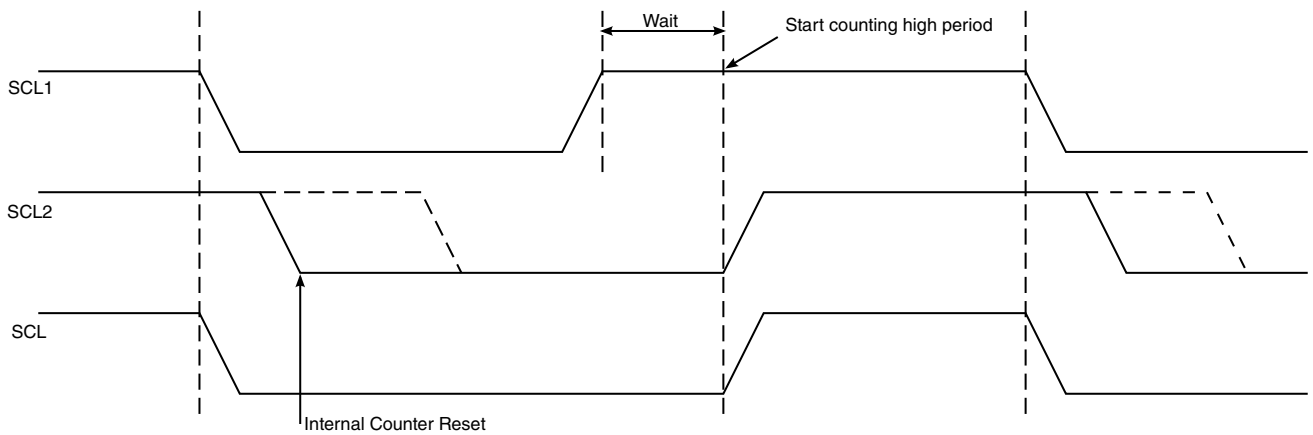

Figure 35-3. Synchronized clock SCL

35.4.4 Handshaking

The clock synchronization mechanism can be used as a handshake in data transfers. Slave devices can hold SCL low after completing one byte transfer (9 bits). In such a case, the clock mechanism halts the bus clock and forces the master clock into a Wait state until the slave releases SCL.

35.4.5 Clock stretching

Slaves can use the clock synchronization mechanism to slow down the transfer bit rate. After the master has driven SCL low, the slave can drive SCL low for the required period and then release it. If the slave SCL low period is longer than the master SCL low period, the resulting SCL bus signal low period is stretched.

35.4.6 Peripheral bus accesses

I2C is a 16-bit block. Only half-word accesses should be performed to the block.

35.4.7 Generation of transfer error on IP bus

If an address is received on the peripheral slave bus interface but it is not implemented, an access error is generated.

35.4.8 Reset

The I2C can be reset in the following ways:

- Global reset: A hard asynchronous reset of the whole I2C
- Software reset: An internal reset for the whole I2C (except for I2C_IADR and I2C_IFDR registers) initiated by deasserting the I2C_I2CR[IEN] bit

35.4.9 Interrupts

There is only one interrupt from the block, which is enabled by setting the I2C_I2CR[IIEN] bit.

The interrupt is generated in any one of the following conditions:

- One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).
- An address is received that matches its own specific address in Slave Receive mode.
- Arbitration is lost.

35.4.10 Byte order

The block only supports the Little-Endian mode.

35.5 Initialization

NOTE

Ensure the input select pins for IOMUXC are configured correctly for I2C.

35.5.1 Initialization sequence

Before the interface can transfer serial data, registers must be initialized, as listed here.

1. Set the data sampling rate (I2C_IFDR[IC] to obtain SCL frequency from the system bus clock.
2. Update the address in the (I2C_IADR) to define its slave address (address can range from 0 to 0x7f).
3. Set the I2C enable bit (I2C_I2CR[IEN]) to enable the I2C bus interface system.
4. Modify the bits in the I2C_I2CR to select Master/Slave mode, Transmit/Receive mode, and Interrupt-Enable or not.

35.5.2 Generation of Start

After completion of the initialization procedure, serial data can be transmitted by selecting the Master Transmit mode. On a multimaster bus system, the busy bus (I2C_I2SR[IBB]) must be tested to determine whether the serial bus is free. If the bus is free (IBB = 0), the Start signal and the first byte (the slave address) can be sent. The data written to the data register comprises the address of the desired slave and the LSB indicates the transfer direction.

The free time between a Stop and the next Start condition is built into the hardware that generates the Start cycle. Depending on the relative frequencies of the system clock and the SCL period, it may be necessary to wait until the I2C is not busy after writing the calling address to the data register (I2C_I2DR), before proceeding to load data into the data register (I2C_I2DR).

35.5.3 Post-transfer software response

Sending or receiving a byte sets the data transferring bit (I2C_I2SR[ICF]), which indicates one byte of communication is finished. Upon completion, the interrupt status (I2C_I2SR[IIF]) is also set. An external interrupt is generated if the interrupt enable (I2C_I2CR[IIEN]) is set. The software must first clear the interrupt status (I2C_I2SR[IIF]) in the interrupt routine.

See the flow chart in Figure 35-5.

The data transferring bit (I2C_I2SR[ICF]) is cleared either by reading from I2C_I2DR in Receive mode or by writing to this register in Transmit mode.

The software can service the I2C I/O in the main program by monitoring the interrupt status (I2C_I2SR[IIF]) if the interrupt enable is deasserted. In this case, the interrupt status should be polled in the data transferring bit (I2C_I2SR[ICF]) because the operation is different when arbitration is lost.

When an interrupt occurs at the end of the address cycle, the master is always in Transmit mode; that is, the address is sent. If Master Receive mode is required, then I2C_I2CR[MTX] should be toggled and a dummy read of the I2C_I2DR register must be executed to trigger receive data.

During Slave-mode address cycles (I2C_I2SR[IAAS] = 1), the slave read/write bit I2C_I2SR[SRW] is read to determine the direction of the next transfer. The transmit/receive bit (I2C_I2CR[MTX]) should also be programmed accordingly. For Slave-mode data cycles (IAAS = 0), SRW is invalid. MTX should be read to determine the current transfer direction.

35.5.4 Generation of Stop

A data transfer ends when the master signals a Stop, which can occur after all data is sent.

For a master receiver to terminate a data transfer, it must inform the slave transmitter by not acknowledging the last data byte. This is done by setting the transmit acknowledge bit (I2C_I2CR[TXAK]) before reading the next-to-last byte. Before the last byte is read, a Stop signal must be generated.

35.5.5 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

35.5.6 Slave mode

In the slave interrupt service routine (see Figure 35-5), the block addressed as slave bit (IAAS) should be tested to check if a calling of its own address has just been received. If IAAS is set, software should set the Transmit/Receive mode select bit (I2C_I2CR[MTX]) according to the I2C_I2SR[SRW]. Writing to the I2C_I2CR clears the IAAS automatically. The only time IAAS is read as set is from the interrupt at the end of the address cycle where an address match occurred; interrupts resulting from subsequent data transfers will have IAAS cleared. A data transfer can now be initiated by writing information to I2C_I2DR for slave transmits, or read from I2C_I2DR in Slave Receive mode. A dummy read of I2C_I2DR in Slave Receive mode releases SCL, allowing the master to send data.

In the slave transmitter routine, the receive acknowledge bit (I2C_I2SR[RXAK]) must be tested before sending the next byte of data. Setting RXAK means an end-of-data signal from the master receiver, after which the software must switch it from Transmit to Receiver mode. Reading the data register (I2C_I2DR) then releases SCL so the master can generate a Stop signal.

35.5.7 Arbitration lost

If several devices try to engage the bus at the same time, one becomes master. Hardware immediately switches devices that lose arbitration to Slave Receive mode. Data output to 12Cn_SDA stops, but 12Cn_SCL is still generated until the end of the byte during which arbitration is lost. An interrupt occurs at the falling edge of the ninth clock of this transfer if the arbitration is lost (I2C_I2SR[IAL] = 1), and the Slave mode is selected (I2C_I2CR[MSTA] = 0).

See the flow chart in Figure 35-5.

If a device that is not a master tries to transmit or do a Start, hardware inhibits the transmission, clears MSTA without signaling a Stop, generates an interrupt to the ARM platform, and sets I2C_I2SR[IAL] to indicate a failed attempt to engage the bus. When considering these cases, the slave service routine should first test I2C_I2SR[IAL], and the software should clear it if it is set.

For Multimaster mode, when an I2C is enabled when the bus is busy and asserts Start, the I2C_I2SR[IAL] bit gets set only for 12Cn_SDA=0, 12Cn_SCL=0/1, 12Cn_SDA=1, and 12Cn_SCL=0; but not for 12Cn_SDA=1 and I2Cn_SCL=1, which is the equivalent of Bus Idle state.

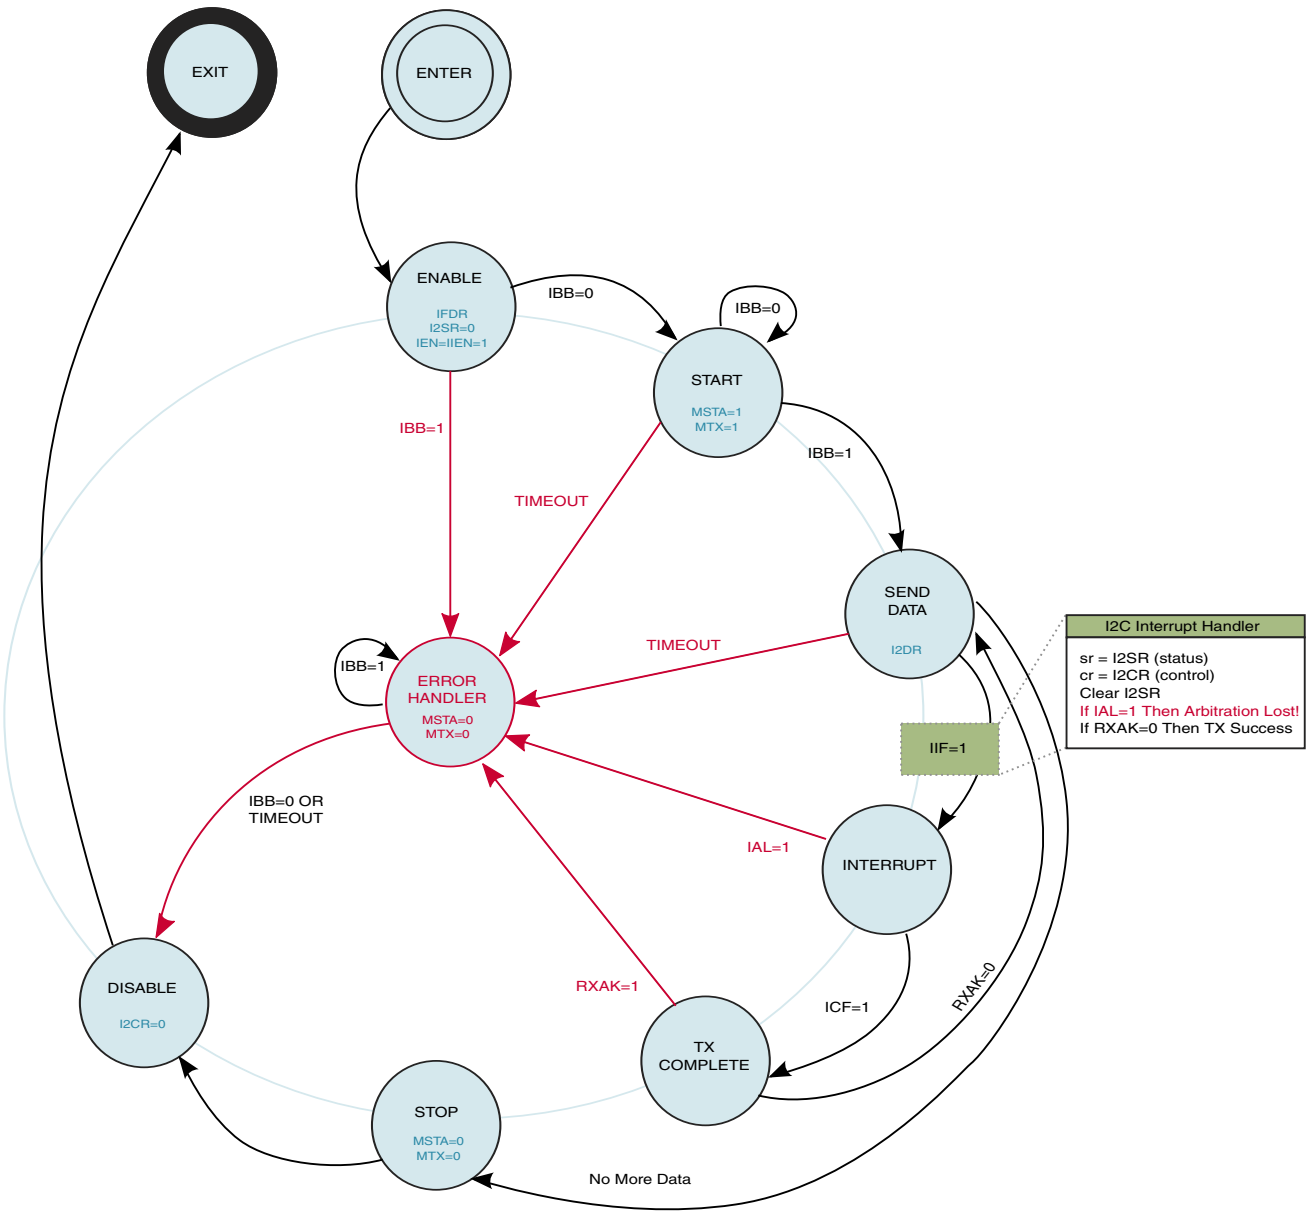

Figure 35-4. I2C Programming state diagram

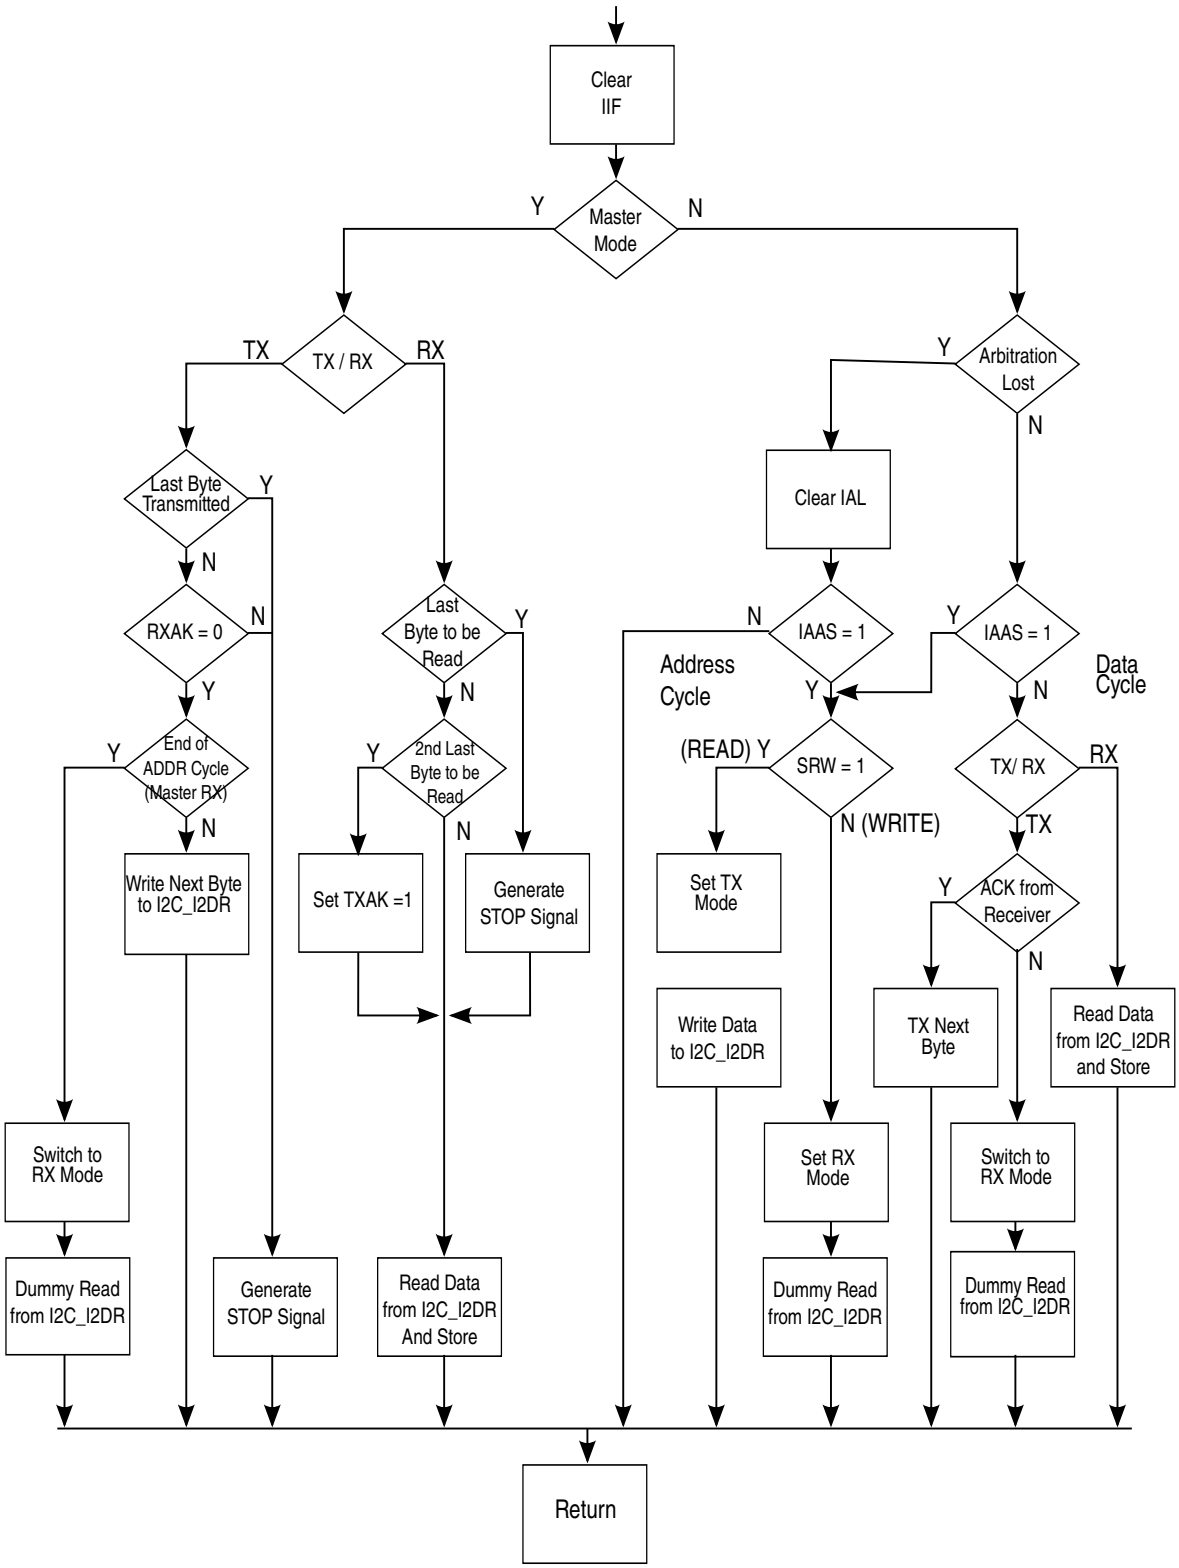

Figure 35-5. Flowchart of typical I2C interrupt routine

NOTE

For a Repeated Start only, the Stop-generation stage does not occur in Master mode. A loop repeats itself without stopping for the next start.

For Master Receive mode, I2C is programmed as Master Transmit during Address mode and after slave address transfer; the MTX bit should be cleared and a dummy read on the I2C_I2DR register should be performed so I2C can read the next receive data.

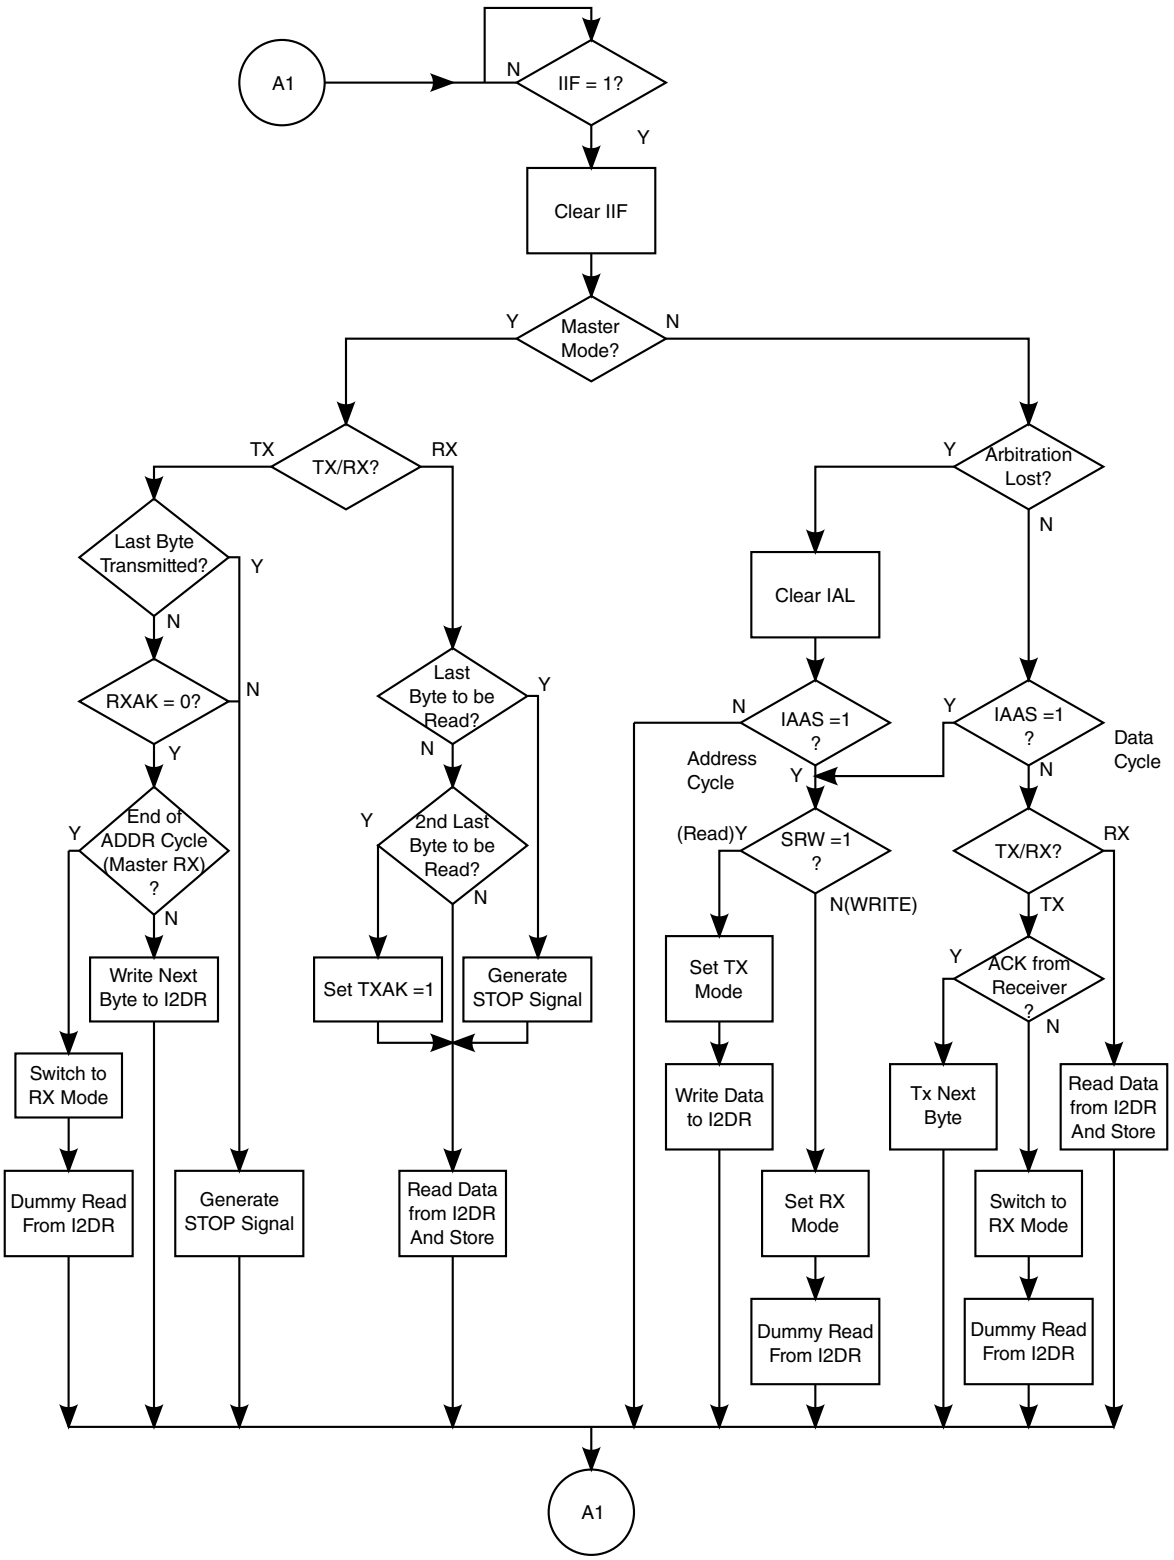

Figure 35-6. Flowchart for typical I2C polling routine

NOTE

The timeout value depends on the bus frequency at which I2C is operating. The minimum timeout for polling the IIF bit at a maximum I2C bus frequency of 400 kHz is T_{min} = 25 µs (=2.5 x 10 µs). This value can be calculated for any bus frequency. The formula is $T_{min} = 10/F_{SCL}$, where F_{SCL} is the frequency of the I2C clock (SCL).

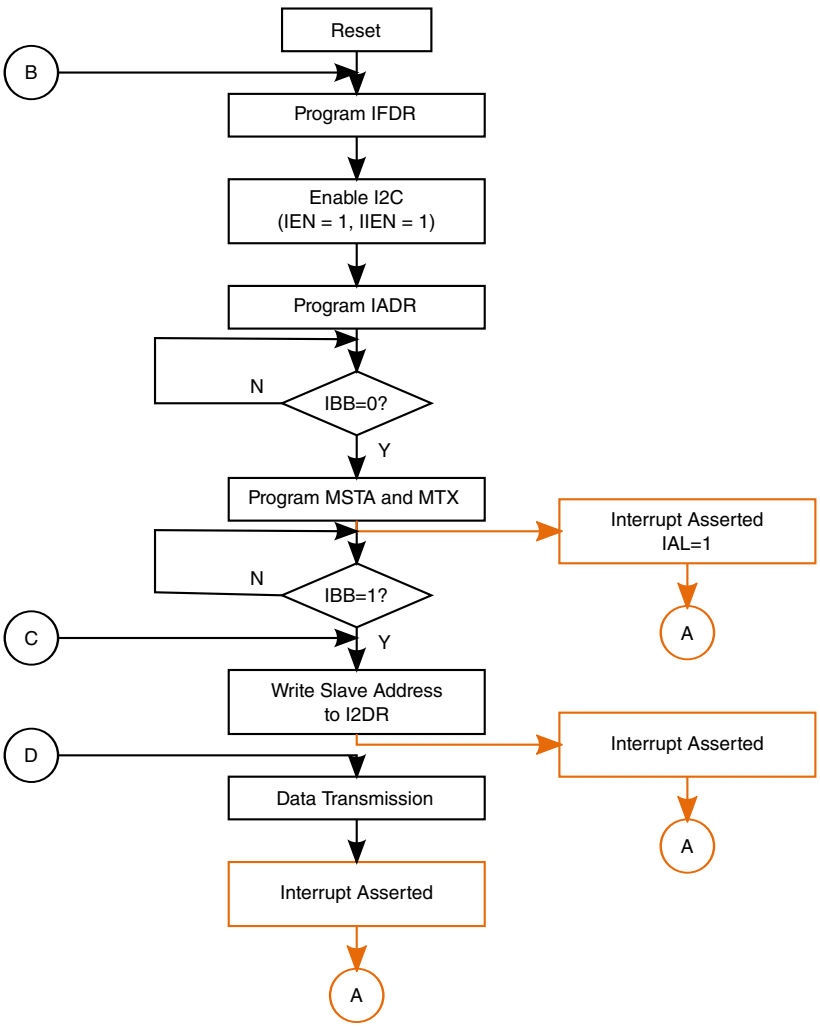

Figure 35-7. Detailed flowchart of a typical I2C Master Transmit mode, part 1

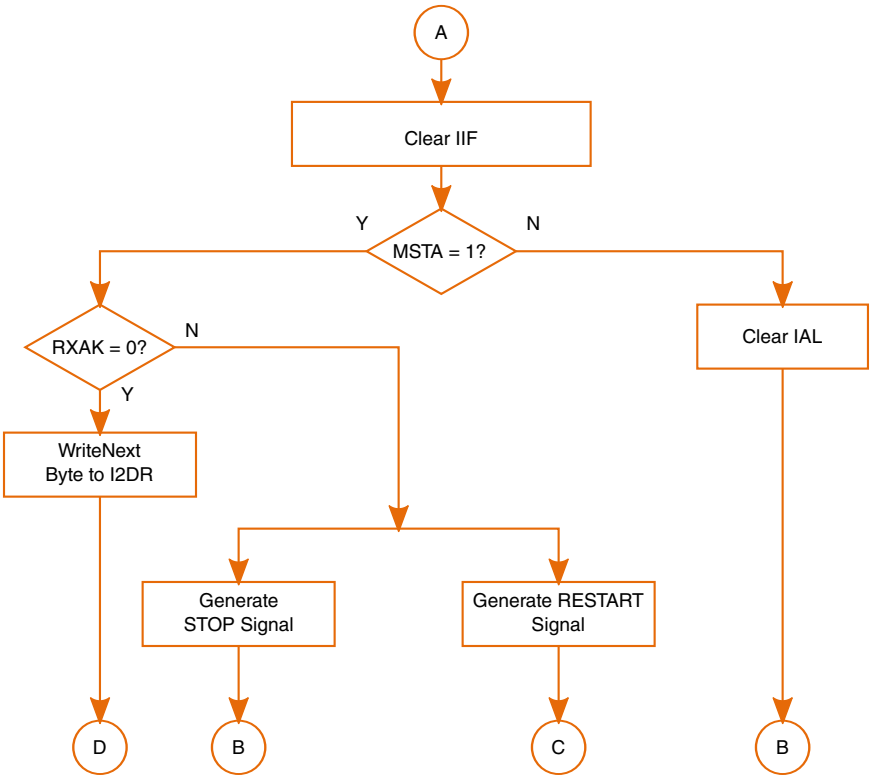

Figure 35-8. Detailed flowchart of a typical I2C Master Transmit mode, part 2

Figure 35-7 and Figure 35-8 show the Master Transmit mode operation with interrupt subroutine. If an interrupt is generated and the MSTA bit is 0, then bus arbitration is lost and IAL is set. Software can clear the IAL bit and reprogram I2C. If the MSTA bit is 1, then it is a transfer-generated interrupt. In this case, software can check the RXAK bit for a data receive acknowledgement by the slave and, accordingly, decide to do one of the following:

- Generate a STOP
- Generate a REPEATED START by writing to the I2C_I2CR register
- Perform the next data transfer by writing to the I2C_I2DR register

NOTE

The IBB bit is asserted by a Start condition on the bus, and it is deasserted by a Stop condition on the bus. Therefore, if arbitration is lost due to an unexpected Stop condition during transfer, then IBB is cleared. If arbitration is lost due to a data mismatch, then it is not cleared. Software should always clear the IEN bit and then set it if arbitration is lost.

35.6 Software restriction

Software should ensure that there is a delay of at least two module clock cycles after it sets the I2C_I2CR[RSTA] bit and before writing to the I2C_I2DR register. The maximum possible clock period of the module clock is 78 ns.

35.7 I2C Memory Map/Register Definition

The I2C contains five 16-bit registers.

NOTE

Registers at offsets 0x0002, 0x0006, 0x000A, and 0x000E are reserved for future additions.

I2C memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21A_0000	I2C Address Register (I2C1_IADR)	16	R/W	0000h	35.7.1/1903
21A_0004	I2C Frequency Divider Register (I2C1_IFDR)	16	R/W	0000h	35.7.2/1903

35.7.1 I2C Address Register (I2Cx_IADR)

Address: Base address + 0h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								ADR							0
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Cx_IADR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7–1 ADR	Slave address. Contains the specific slave address to be used by the I2C. Slave mode is the default I2C mode for an address match on the bus. **NOTE:** The I2C_IADR holds the address to which the I2C responds when addressed as a slave. The slave address is not the address sent on the bus during the address transfer. The register is not reset by a software reset.
0 Reserved	This read-only field is reserved and always has the value 0.

35.7.2 I2C Frequency Divider Register (I2Cx_IFDR)

The I2C_IFDR provides a programmable prescaler to configure the clock for bit-rate selection. The register does not get reset by a software reset.

I2C clock is sourced from PERCLK_ROOT which is routed from IPG_CLK_ROOT. I2C clock frequency can easily obtained by using the following formula:

I2C clock Frequency = (PERCLK_ROOT frequency)/(division factor corresponding to IFDR)

By default, IPG_CLK_ROOT and PERCLK_ROOT frequencies are set to 49.5MHz, where the root clock is sourced from PLL2's PFD2. Obtaining the frequencies can be accomplished by:

PLL2 = 528MHz

PLL2_PFD2 = 528MHz * 18 / 24 = 396MHz

IPG_CLK_ROOT = (PLL2_PFD2 / ahb_podf)/ ipg_podf = (396MHz/4)/2 = 49.5MHz

PER_CLK_ROOT = IPG_CLK_ROOT/perclk_podf = 49.5MHz/1 = 49.5MHz

NOTE

The above calculation assumes that the default CCM register settings, routing, and division factors are used. If different routing, PFD values, and/or division factors are used, the user must adjust the parameters accordingly to calculate the correct clock frequency.

The following table describes the divider and register values for the register field "IC."

Table 35-3. I2C_IFDR Register Field Values

IC	Divider		IC	Divider		IC	Divider		IC	Divider
0x00	30		0x10	288		0x20	22		0x30	160

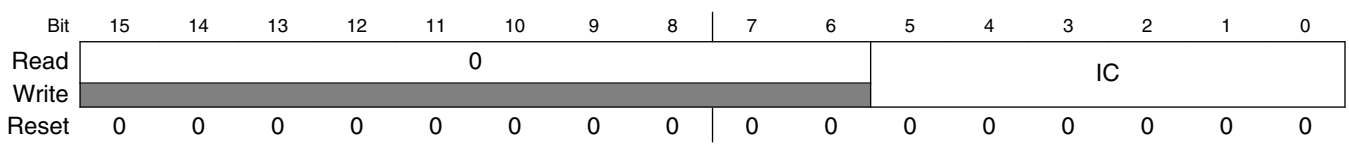
Address: Base address + 4h offset



I2Cx_IFDR field descriptions

Field	Description
15–6 Reserved	This read-only field is reserved and always has the value 0.
IC	I2C clock rate. Prescales the clock for bit-rate selection. Due to potentially slow I2Cn_SCL and I2Cn_SDA rise and fall times, bus signals are sampled at the prescaler frequency. The serial bit clock frequency may be lower than IPG_CLK_ROOT divided by the divider shown in the I2C Data I/O Register. **NOTE:** The IC value should not be changed during the data transfer, however, it can be changed before a Repeat Start or Start programming sequence in I2C. The I2C protocol supports bit rates of up to 400 kbps. The IC bits need to be programmed in accordance with this constraint.

35.7.3 I2C Control Register (I2Cx_I2CR)

The I2C_I2CR is used to enable the I2C and the I2C interrupt. It also contains bits that govern operation as a slave or a master.

Address: Base address + 8h offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read	IEN	IIEN	MSTA	MTX	TXAK	0	0	
Write						RSTA		
Reset	0	0	0	0	0	0	0	0

I2Cx_I2CR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 IEN	I2C enable. Also controls the software reset of the entire I2C. Resetting the bit generates an internal reset to the block. If the block is enabled in the middle of a byte transfer, Slave mode ignores the current bus transfer and starts operating when the next Start condition is detected. Master mode is not aware that the bus is busy, so initiating a start cycle may corrupt the current bus cycle, ultimately causing either the current master or the I2C to lose arbitration. Subsequently, bus operation returns to normal. 0 The block is disabled, but registers can still be accessed. 1 The I2C is enabled. This bit must be set before any other I2C_I2CR bits have an effect.
6 IIEN	I2C interrupt enable. **NOTE:** If data is written during the Start condition, that is, just after setting the I2C_I2CR[MSTA] and I2C_I2CR[MTX] bits, then the ICF bit is cleared at the falling edge of SCLK after Start. If data is written after the Start condition and falling edge of SCLK, then the ICF bit is cleared as soon as data is written. 0 I2C interrupts are disabled, but the status flag I2C_I2SR[IIF] continues to be set when an Interrupt condition occurs. 1 I2C interrupts are enabled. An I2C interrupt occurs if I2C_I2SR[IIF] is also set.
5 MSTA	Master/Slave mode select bit. If the master loses arbitration, MSTA is cleared without generating a Stop signal. **NOTE:** The module clock should be on for writing to the MSTA bit. **NOTE:** The MSTA bit is cleared by software to generate a Stop condition; it can also be cleared by hardware when the I2C loses the bus arbitration.

Table continues on the next page...

I2Cx_I2CR field descriptions (continued)

Field	Description
	0 Slave mode. Changing MSTA from 1 to 0 generates a Stop and selects Slave mode. 1 Master mode. Changing MSTA from 0 to 1 signals a Start on the bus and selects Master mode.
4 MTX	Transmit/Receive mode select bit. Selects the direction of master and slave transfers. 0 Receive. When a slave is addressed, the software should set MTX according to the slave read/write bit in the I2C status register (I2C_I2SR[SRW]). 1 Transmit. In Master mode, MTX should be set according to the type of transfer required. Therefore, for address cycles, MTX is always 1.
3 TXAK	Transmit acknowledge enable. Specifies the value driven onto I2Cn_SDA during acknowledge cycles for both master and slave receivers. **NOTE:** Writing TXAK applies only when the I2C bus is a receiver. 0 An acknowledge signal is sent to the bus at the ninth clock bit after receiving one byte of data. 1 No acknowledge signal response is sent (that is, the acknowledge bit = 1).
2 RSTA	Repeat start. Always reads as 0. Attempting a repeat start without bus mastership causes loss of arbitration. 0 No repeat start 1 Generates a Repeated Start condition
Reserved	This read-only field is reserved and always has the value 0.

35.7.4 I2C Status Register (I2Cx_I2SR)

The I2C_I2SR contains bits that indicate transaction direction and status.

Address: Base address + Ch offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read	ICF	IAAS	IBB	IAL	0	SRW	IIF	RXAK
Write								
Reset	1	0	0	0	0	0	0	1

I2Cx_I2SR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 ICF	Data transferring bit. While one byte of data is transferred, ICF is cleared. 0 Transfer is in progress. 1 Transfer is complete. This bit is set by the falling edge of the ninth clock of the last byte transfer.
6 IAAS	I2C addressed as a slave bit. The ARM platform is interrupted if the interrupt enable (I2C_I2CR[IIEN]) is set. The ARM platform must check the slave read/write bit (SRW) and set its Transfer/Receive mode accordingly. Writing to I2C_I2CR clears this bit. 0 Not addressed 1 Addressed as a slave. Set when its own address (I2C_IADR) matches the calling address.
5 IBB	I2C bus busy bit. Indicates the status of the bus. **NOTE:** When I2C is enabled (I2C_I2CR[IEN] = 1), it continuously polls the bus data (SDA) and clock (SCL) signals to determine a Start or Stop condition. 0 Bus is idle. If a Stop signal is detected, IBB is cleared. 1 Bus is busy. When Start is detected, IBB is set.
4 IAL	Arbitration lost. Set by hardware in the following circumstances (IAL must be cleared by software by writing a "0" to it at the start of the interrupt service routine): • I2Cn_SDA input samples low when the master drives high during an address or data-transmit cycle. • I2Cn_SDA input samples low when the master drives high during the acknowledge bit of a data-receive cycle. For the above two cases, the bit is set at the falling edge of the ninth I2Cn_SCL clock during the ACK cycle. • A Start cycle is attempted when the bus is busy. • A Repeated Start cycle is requested in Slave mode. • A Stop condition is detected when the master did not request it. **NOTE:** Software cannot set the bit. 0 No arbitration lost. 1 Arbitration is lost.
3 Reserved	This read-only field is reserved and always has the value 0.
2 SRW	Slave read/write. When the I2C is addressed as a slave, IAAS is set, and the slave read/write bit (SRW) indicates the value of the R/W command bit of the calling address sent from the master. SRW is valid only when a complete transfer has occurred, no other transfers have been initiated, and the I2C is a slave and has an address match. 0 Slave receive, master writing to slave 1 Slave transmit, master reading from slave
1 IIF	I2C interrupt. Must be cleared by the software by writing a "0" to it in the interrupt routine. **NOTE:** The software cannot set the bit. 0 No I2C interrupt pending. 1 An interrupt is pending.

Table continues on the next page...

I2Cx_I2SR field descriptions (continued)

Field	Description
	This causes a processor interrupt request (if the interrupt enable is asserted [IIEN = 1]). The interrupt is set when one of the following occurs: • One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock). • An address is received that matches its own specific address in Slave Receive mode. • Arbitration is lost.
0 RXAK	Received acknowledge. This is the value received from the I2Cn_SDA input for the acknowledge bit during a bus cycle. 0 An "acknowledge" signal was received after the completion of an 8-bit data transmission on the bus. 1 A "No acknowledge" signal was detected at the ninth clock.

35.7.5 I2C Data I/O Register (I2Cx_I2DR)

In Master Receive mode, reading the data register allows a read to occur and initiates the next byte to be received. In Slave mode, the same function is available after it is addressed.

Address: Base address + 10h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								DATA							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Cx_I2DR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
DATA	Data Byte. Holds the last data byte received or the next data byte to be transferred. Software writes the next data byte to be transmitted or reads the data byte received. **NOTE:** The core-written value in I2C_I2DR cannot be read back by the core. Only data written by the I2C bus side can be read.

Chapter 36
IOMUX Controller (IOMUXC)

36.1 Overview

The IOMUX Controller (IOMUXC), together with the IOMUX, enables the IC to share one pad to several functional blocks. This sharing is done by multiplexing the pad's input and output signals.

Every module requires a specific pad setting (such as pull up or keeper), and for each pad, there are up to 8 muxing options (called ALT modes). The pad settings parameters are controlled by the IOMUXC.

The IOMUX consists only of combinatorial logic combined from several basic IOMUX cells. Each basic IOMUX cell handles only one pad signal's muxing.

Figure 36-1 illustrates the IOMUX/IOMUXC connectivity in the system.

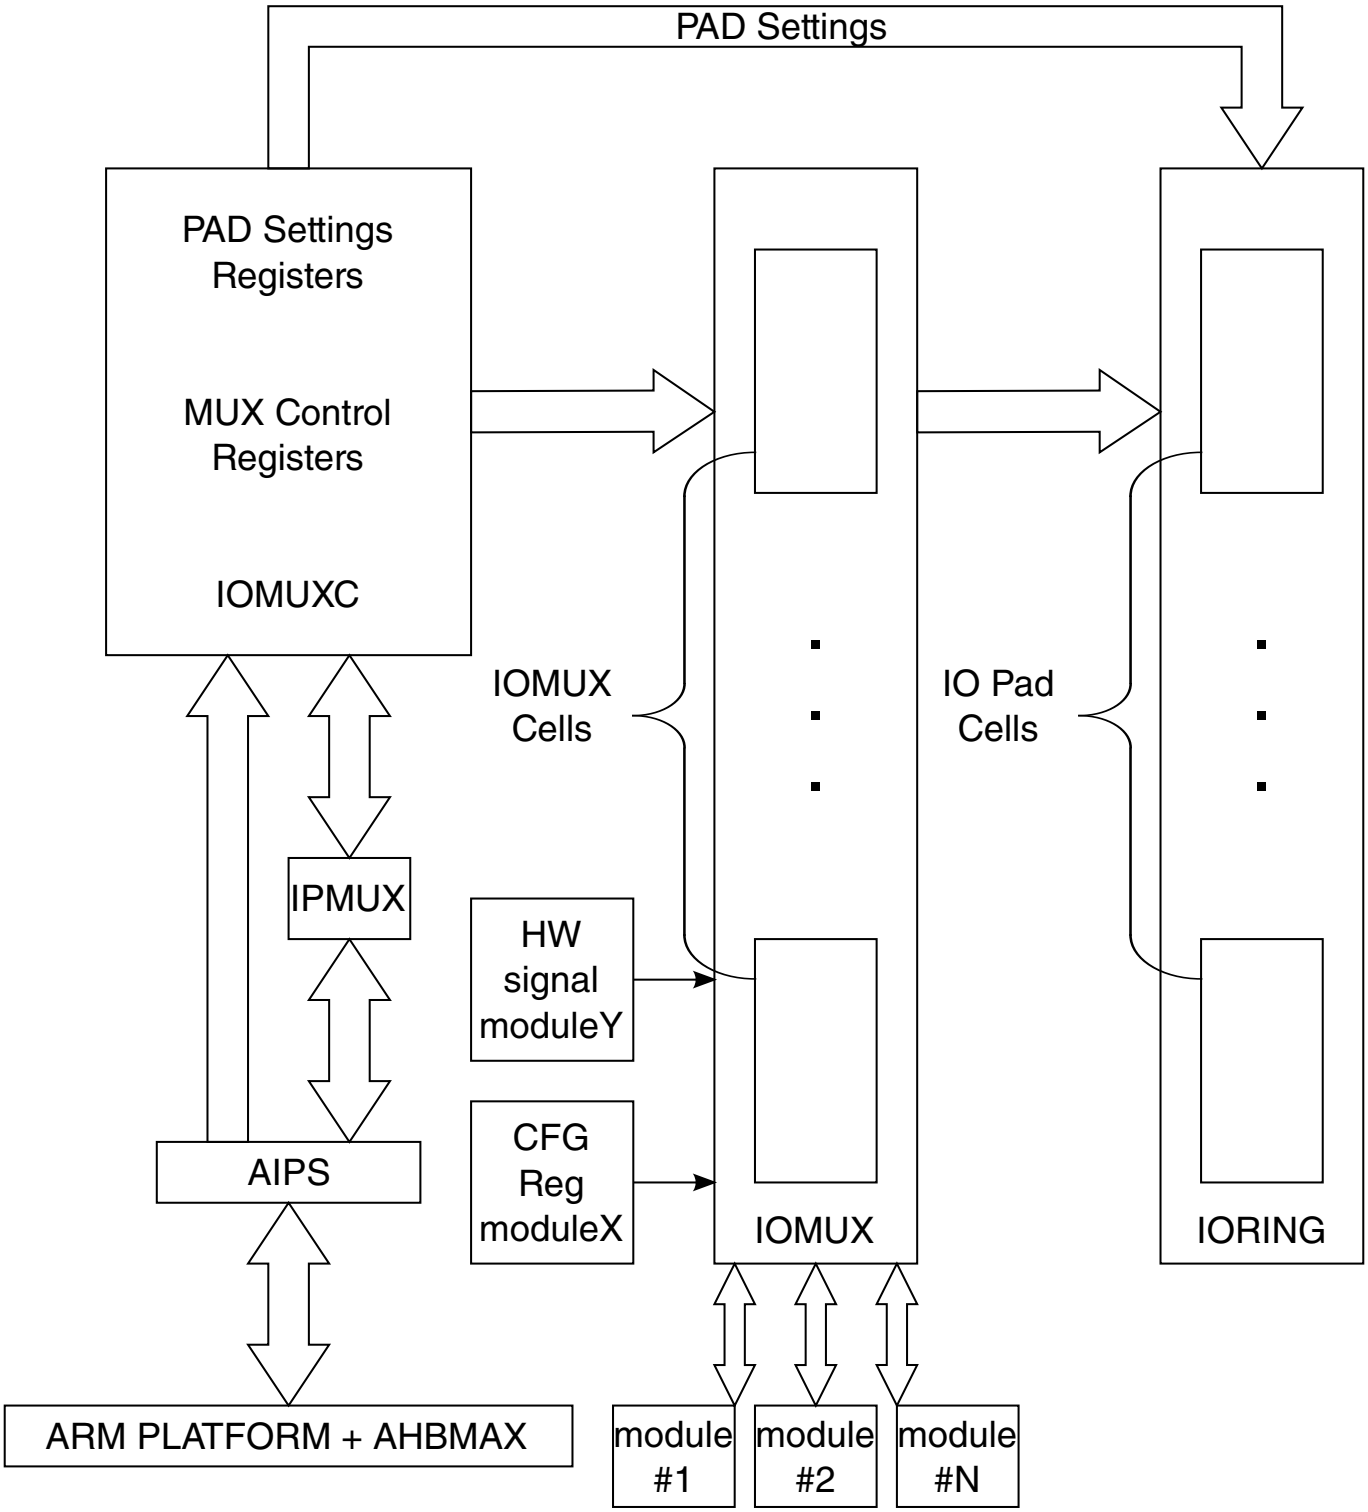


Figure 36-1. IOMUX SoC Level Block Diagram

36.1.1 Features

The IOMUXC features are:

- 32-bit software mux control registers (IOMUXC_SW_MUX_CTL_PAD_<PAD NAME> or IOMUXC_SW_MUX_CTL_GRP_<GROUP NAME>) to configure 1 of 8 alternate (ALT) MUX_MODE feilds of each pad or a predefined group of pads and to enable the forcing of an input path of the pad(s) (SION bit).
- 32-bit software pad control registers (IOMUXC_SW_PAD_CTL_PAD_<PAD_NAME> or IOMUXC_SW_PAD_CTL_GRP_<GROUP NAME>) to configure specific pad settings of each pad, or a predefined group of pads.
- 32-bit general purpose registers - 14 (GPR0 to GPR13) 32-bit registers according to SoC requirements for any usage.
- 32-bit input select control registers to control the input path to a module when more than one pad drives this module input.

Each SW MUX/PAD CTL IOMUXC register handles only one pad or one pad's group.

Only the minimum number of registers required by software are implemented by hardware. For example, if only ALT0 and ALT1 modes are used on Pad x then only one bit register will be generated as the MUX_MODE control field in the software mux control register of Pad x.

The software mux control registers may allow the forcing of pads to become input (input path enabled) regardless of the functional direction driven. This may be useful for loopback and GPIO data capture.

36.2 Clocks

The table found here describes the clock sources for IOMUXC.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 36-1. IOMUXC Clocks

Clock name	Clock Root	Description
ipt_clk_io	enfc_clk_root	IO clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

36.3 Functional description

This section provides a complete functional description of the block.

The IOMUXC consists of two sub-blocks:

- IOMUXC_REGISTERS includes all of the IOMUXC registers (see Features).
- IOMUXC_LOGIC includes all of the IOMUXC combinatorial logic (IP interface controls, address decoder, observability muxes).

The IOMUX consists of a number (about the number of pads in the SoC) of basic iomux_cell units. If only one functional mode is required for a specific pad, there is no need for IOMUX and the signals can be connected directly from the module to the I/O. The IOMUX cell is required whenever two or more functional modes are required for a specific pad or when one functional mode and the one test mode are required.

The basic iomux_cell design, which allows two levels of HW signal control (in ALT6 and ALT7 modes - ALT7 gets highest priority) is shown in Figure 36-2.

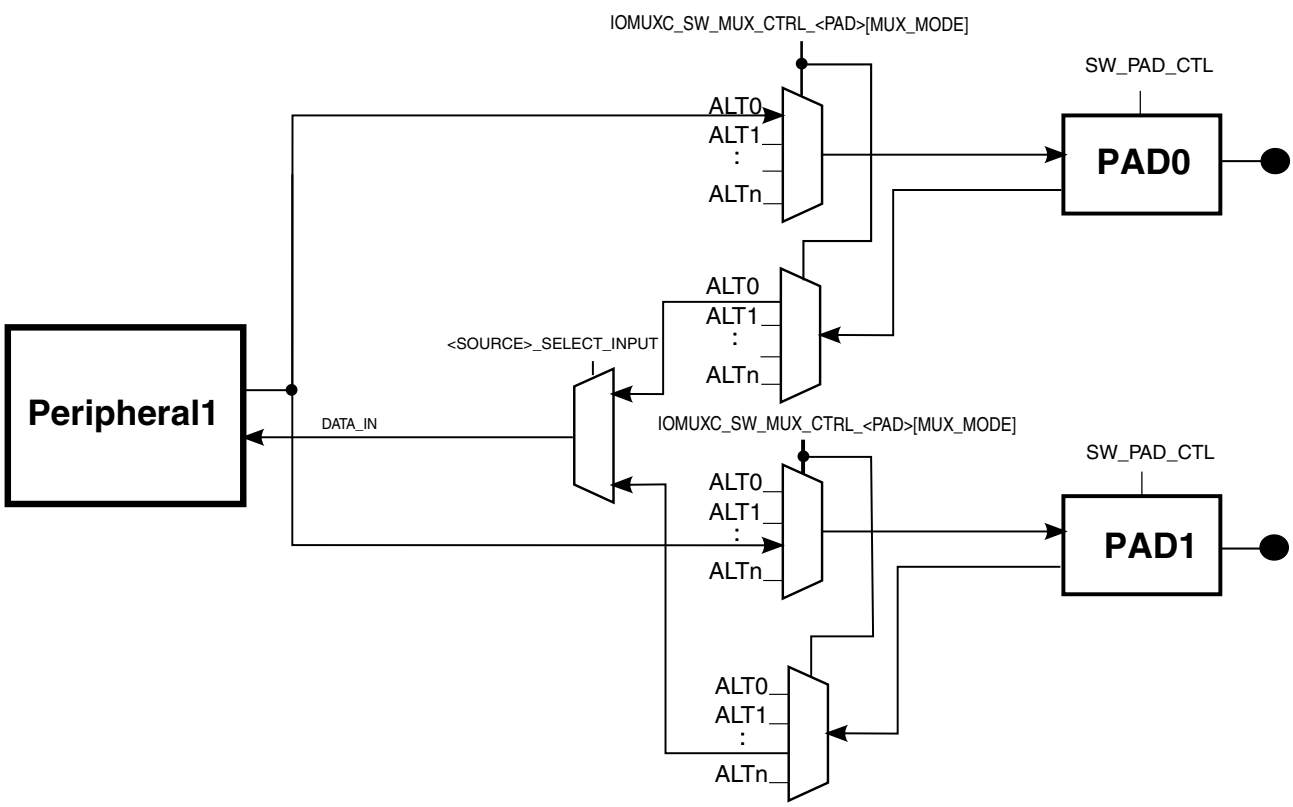

Figure 36-2. IOMUX Cell Block Diagram

36.3.1 ALT6 and ALT7 extended muxing modes

The ALT7 and ALT6 extended muxing modes allow any signal in the system (such as fuse, pad input, JTAG, or software register) to override any software configuration and to force the ALT6/ALT7 muxing mode.

It also allows an IOMUX software register to control a group of pads.

36.3.2 SW Loopback through SION bit

A limited option exists to override the default pad functionality and force the input path to be active (ipp_ibe==1'b1) regardless of the value driven by the corresponding module. This can be done by setting the SION (Software Input On) bit in the IOMUXC_SW_MUX_CTL register (when available) to "1".

Uses include:

- LoopBack - Module x drives the pad and also receives pad value as an input.
- GPIO Capture - Module x drives the pad and the value is captured by GPIO.

36.3.3 Daisy chain - multi pads driving same module input pin

In some cases, more than one pad may drive a single module input pin. Such cases require the addition of one more level of IOMUXing; all of these input signals are muxed, and a dedicated software controlled register controls the mux in order to select the required input path.

A block port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers).

This means that a block port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers). The daisy chain is illustrated in the figure below.

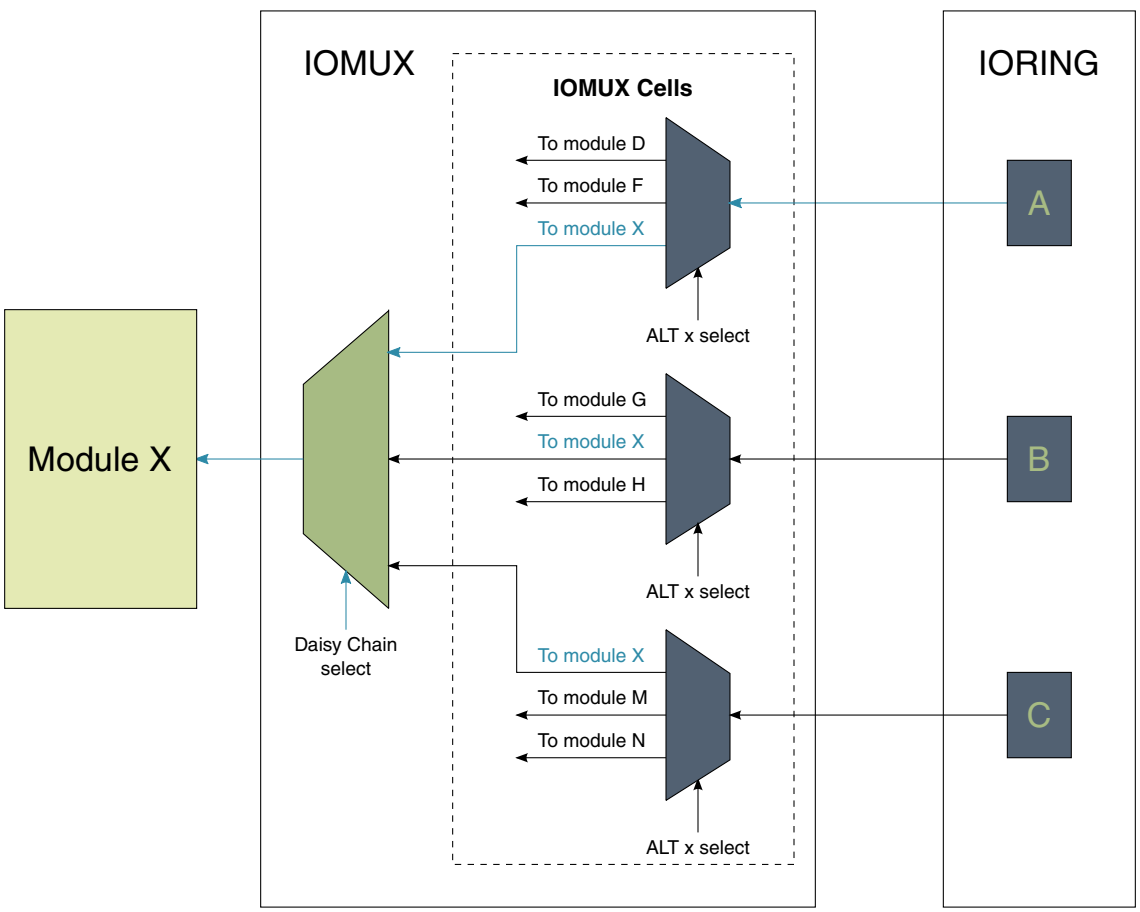

Figure 36-3. Daisy chain illustration

36.4 IOMUXC Memory Map/Register Definition

The main groups of IOMUXC registers are:

The General Purpose Registers IOMUXC_GPR[13:0] are used to select operating modes for general features in the SoC, usually not related to the IOMUX itself.

The Software MUX Control Registers are used to configure the IOMUX muxing, and "connect" the pad to a given port in a module.

The PAD Settings Registers are used to control the pad settings configuration. For some pads (in order to save chip route) the pad settings are grouped in one register; changing the group register will affect the settings for all pads in the group.

The following table shows the IOMUXC register summary.

IOMUXC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20E_0000	GPR (IOMUXC_GPR0)	32	R/W	0000_0000h	36.4.1/1942

IOMUXC_GPR1 field descriptions

Field	Description
31 CFG_L1_CLK_REMOVAL_EN	PCIe_CTL (CLK LOGIC CONTROLLER GLUE) - Enable the reference clock removal in L1 state. This is a bit from application register.
30 APP_CLK_REQ_N	PCIe_CTL (CLK LOGIC CONTROLLER GLUE) - Indicates that application logic is ready to have reference clock removed.
29 Reserved	This read-only field is reserved and always has the value 0.
28 APP_REQ_EXIT_L1	PCIe_CTL - Application Request to Exit L1. Request from the application to exit ASPM state L1. 0 PCIe application request is not set 1 PCIe application request is set
27 APP_READY_ENTR_L23	PCIe_CTL - Application Ready to Enter L23. Indication from the application that it is ready to enter the L23 state. 0 PCIe application is not ready to enter L23 1 PCIe application is ready to enter L23
26 APP_REQ_ENTR_L1	PCIe_CTL - Application Request to Enter L1. Request from the application to enter ASPM state L1. 0 PCIe application request is not set 1 PCIe application request is set

Table continues on the next page...

IOMUXC_GPR1 field descriptions (continued)

Field	Description
25 MIPI_COLOR_SW	MIPI color switch control 0 MIPI color switch request is not set 1 MIPI color switch request is set
24 MIPI_DPI_OFF	MIPI DPI shutdown request 0 MIPI DPI shutdown request is not set 1 MIPI DPI shutdown request is set
23 Reserved	This read-only field is reserved and always has the value 0.
22 EXC_MON	Exclusive monitor response select of illegal command (of lal gaskets, except MMDC) 0 OKEY response 1 SLVError (default)
21 ENET_CLK_SEL	ENET TX reference clock 0 get enet tx reference clk from pad (external OSC for both external PHY and Internal Controller) 1 get enet tx reference clk from internal clock from anatop (loopback through pad), this clock also sent out to external PHY
20 MIPI_IPU2_MUX	MIPI sensor to IPU-2 mux control 0 Enable mipi to IPU2 CSI1 - virtual channel is fixed to 3. 1 Enable parallel interface to IPU2 CSI1.
19 MIPI_IPU1_MUX	MIPI sensor to IPU-1 mux control 0 Enable mipi to IPU1 CSI0 - virtual channel is fixed to 0. 1 Enable parallel interface to IPU1 CSI0.
18 TEST_POWERDOWN	PCIe_PHY - All Circuits Power-Down Control Function: Powers down all circuitry in the PHY for IDDQ testing. 0 Power down is not requested 1 Power down is requested
17 IPU_VPU_MUX	IPU-1/IPU-2 to VPU signals control. This control selects between IPU-1 and IPU-2 outputs that are going to the VPU (current buffer, new frame, end of line) 0 IPU-1 is selected 1 IPU-2 is selected
16 REF_SSP_EN	PCIe_PHY - Reference Clock Enable for SS function. Function: Enables the reference clock to the prescaler. The phy_ref_ssp_en signal must remain deasserted until the reference clock is running at the appropriate frequency, at which point phy_ref_ssp_en can be asserted. For lower power states, phy_ref_ssp_en can also be deasserted. 0 PCIe PHY reference clock is disabled 1 PCIe PHY reference clock is enabled
15 USB_EXP_MODE	USB Exposure mode 0 Exposure mode is disabled. 1 Exposure mode is enabled.
14 SYS_INT	PCIe_CTL - When SYS_INT goes from low to high, the core generates an Assert_INTx Message. When sys_int goes from high to low, the core generates a Deassert_INTx Message.

Table continues on the next page...

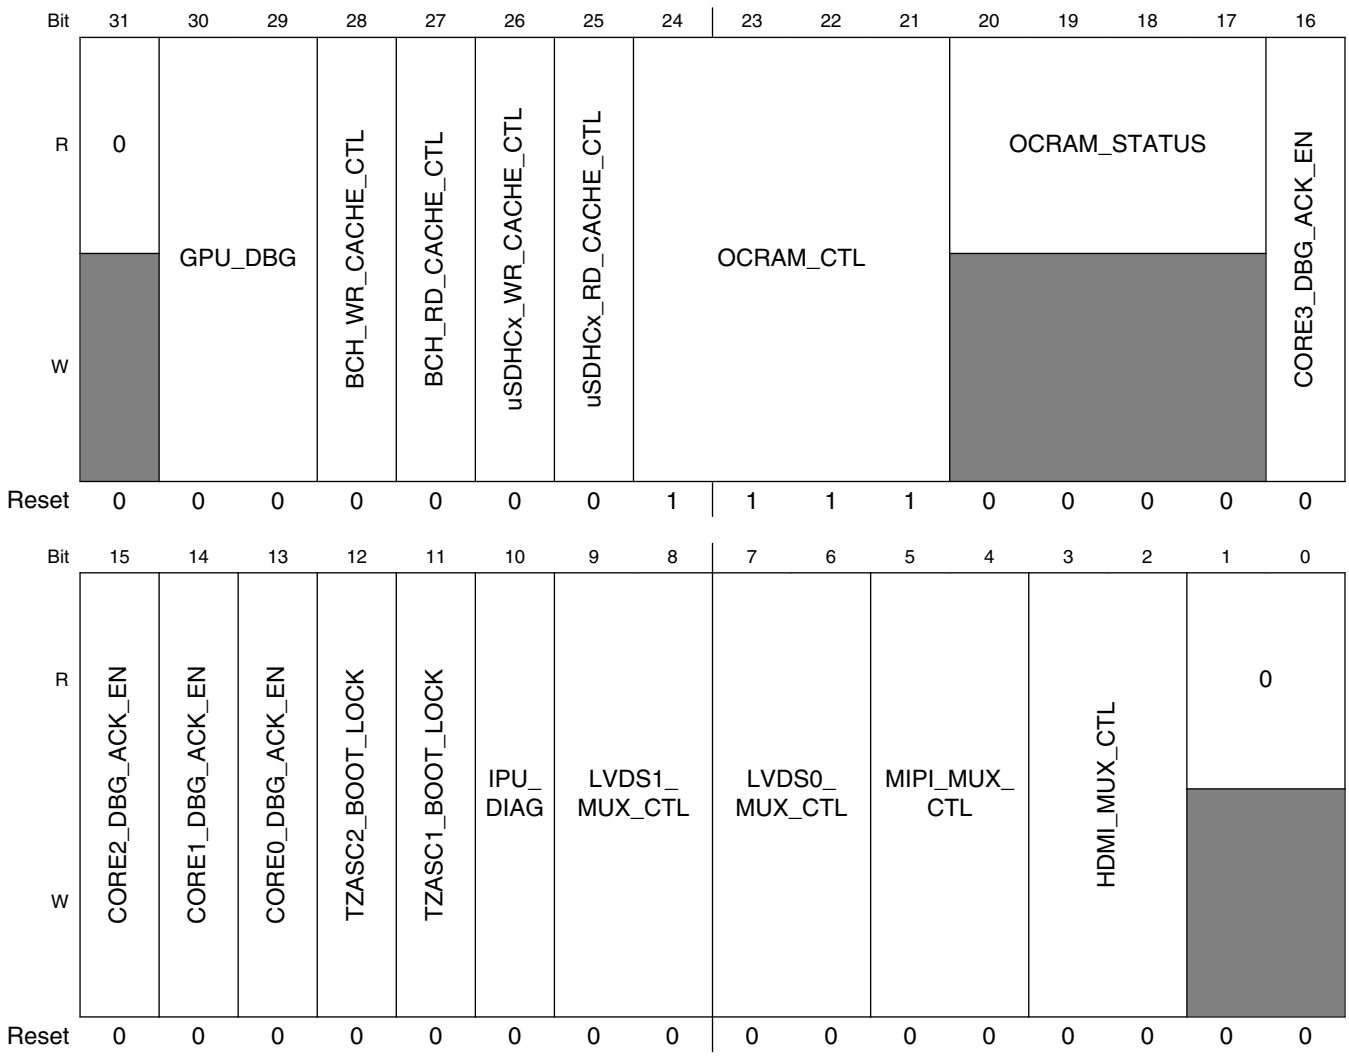
IOMUXC_GPR2 field descriptions (continued)

Field	Description
10 DI1_VS_ POLARITY	Vsync polarity for IPU's DI1 interface. 0 ipu_di1_vsync is active high. 1 ipu_di1_vsync is active low.
9 DI0_VS_ POLARITY	Vsync polarity for IPU's DI0 interface. 0 ipu_di0_vsync is active high. 1 ipu_di0_vsync is active low.
8 BIT_MAPPING_ CH1	Data mapping for LVDS channel 1. 0 Use SPWG standard. 1 Use JEIDA standard.
7 DATA_WIDTH_ CH1	Data width for LVDS channel 1. **NOTE:** This bit must be set when using JEIDA standard (bit_mapping_ch1 is set) 0 Data width is 18 bits wide (lvds1_tx3 is not used) 1 Data width is 24 bits wide.
6 BIT_MAPPING_ CH0	Data mapping for LVDS channel 0. 0 Use SPWG standard. 1 Use JEIDA standard.
5 DATA_WIDTH_ CH0	Data width for LVDS channel 0. **NOTE:** This bit must be set when using JEIDA standard (bit_mapping_ch0 is set) 0 Data width is 18 bits wide (lvds0_tx3 is not used) 1 Data width is 24 bits wide.
4 SPLIT_MODE_ EN	Enable split mode. 0 Split mode is disabled. 1 Split mode is enabled. In this mode both channels should be enabled and working with the same DI (ch0_mode and ch1_mode should both be either '01' or '11')
3–2 CH1_MODE[10]	LVDS channel 1 operation mode 00 Channel disabled. 01 Channel enabled, routed to DI0 10 Channel disabled. 11 Channel enabled, routed to DI1.
CH0_MODE[10]	LVDS channel 0 operation mode 00 Channel disabled. 01 Channel enabled, routed to DI0 10 Channel disabled. 11 Channel enabled, routed to DI1.

36.4.4 GPR (IOMUXC_GPR3)

Address: 20E_0000h base + Ch offset = 20E_000Ch



IOMUXC_GPR3 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 GPU_DBG	GPU debug busses to IOMUX 00 GPU3D 01 GPU2D 10 OpenVG 11 Reserved

Table continues on the next page...

IOMUXC_GPR3 field descriptions (continued)

Field	Description
28 BCH_WR_ CACHE_CTL	Control BCH block cacheable attribute of AXI write transactions [1] 0 Cacheable attribute is off for write transactions. 1 Cacheable attribute is on for write transactions.
27 BCH_RD_ CACHE_CTL	Control BCH block cacheable attribute of AXI read transactions [1] 0 Cacheable attribute is off for read transactions. 1 Cacheable attribute is on for read transactions.
26 uSDHCx_WR_ CACHE_CTL	Control uSDHCx [1-4] blocks cacheable attribute of AXI write transactions [1] 0 Cacheable attribute is off for write transactions. 1 Cacheable attribute is on for write transactions.
25 uSDHCx_RD_ CACHE_CTL	Control uSDHCx [1-4] blocks cacheable attribute of AXI read transactions [1] 0 Cacheable attribute is off for read transactions. 1 Cacheable attribute is on for read transactions.
24–21 OCRAM_CTL	OCRAM_CTL[24] write address pipeline control bit. When this feature is enabled, the write address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid any setup time issue for the write access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI write transaction, i.e., at most 1 more clock cycle for each write burst with multiple beats of data. When this feature is disabled, the write address from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write data is also ready at this cycle). 0 write address pipeline is disabled 1 write address pipeline is enabled OCRAM_CTL[23] - write data pipeline control bit When this feature is enabled, the write data from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid any setup time issue for the write access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI write transaction, i.e., at most 1 more clock cycle for each write burst with multiple beats of data. When this feature is disabled, the write data from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write address is also ready at this cycle). 0 write data pipeline is disabled 1 write data pipeline is enabled OCRAM_CTL[22] read address pipeline control bit. When this feature is enabled, the read address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid any setup time issue for the read access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI read transaction, i.e., at most 1 more clock cycle for each read burst with multiple beats of data. When this feature is disabled, the read address from the AXI master can be accepted by the on-chip RAM without delay, and data can become ready for master at next clock cycle (if no other access and no read data wait). 0 read address pipeline is disabled 1 read address pipeline is enabled OCRAM_CTL[21] - read data wait state control bit

Table continues on the next page...

IOMUXC_GPR3 field descriptions (continued)

Field	Description
	When the read data wait state is enabled, it will cost 2 cycles for each read access, (each beat of a read burst). This can avoid the potential timing problem caused by the relatively longer memory access time at higher frequency. When this feature is disabled, it only costs 1 clock cycle to finish a read transaction, i.e., get read data back in the next cycle of read request becomes valid on the bus. 0 read data pipeline is disabled 1 read data pipeline is enabled
20–17 OCRAM_ STATUS	This field shows the OCRAM pipeline settings status, controlled by OCRAM_CTL[24:21] bits respectively. When the control bit is changed, the corresponding status bit goes high and keeps high until this new configuration is applied the internal logic. This provides a way for software to detect that the configuration has become valid. The suggested flow for changing the configuration in software is: • set/clear the control bit • poll the status bit until it goes to 0 OCRAM_STATUS[17] shows the write address pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory. OCRAM_STATUS[18] shows the write data pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory. OCRAM_STATUS[19] shows the read address pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory. OCRAM_STATUS[20] shows the read data pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory. 0 read data pipeline configuration valid 1 read data pipeline control bit changed
16 CORE3_DBG_ ACK_EN	Mask control of Core 3 debug acknowledge to global debug acknowledge 0 Core 3 debug acknowledge is part of global acknowledge. 1 Core 3 debug acknowledge is masked by this bit, and it is not part of global acknowledge.
15 CORE2_DBG_ ACK_EN	Mask control of Core 2 debug acknowledge to global debug acknowledge 0 Core 2 debug acknowledge is part of global acknowledge. 1 Core 2 debug acknowledge is masked by this bit, and it is not part of global acknowledge.
14 CORE1_DBG_ ACK_EN	Mask control of Core 1 debug acknowledge to global debug acknowledge. 0 Core 1 debug acknowledge is part of global acknowledge. 1 Core 1 debug acknowledge is masked by this bit, and it is not part of global acknowledge.
13 CORE0_DBG_ ACK_EN	Mask control of Core 1 debug acknowledge to global debug acknowledge 0 Core 0 debug acknowledge is part of global acknowledge. 1 Core 0 debug acknowledge is masked by this bit, and it is not part of global acknowledge.
12 TZASC2_BOOT_ LOCK	TZASC-2 secure boot lock 0 secure boot lock is disabled. 1 secure boot lock is enabled
11 TZASC1_BOOT_ LOCK	TZASC-1 secure boot lock 0 secure boot lock is disabled. 1 secure boot lock is enabled

Table continues on the next page...

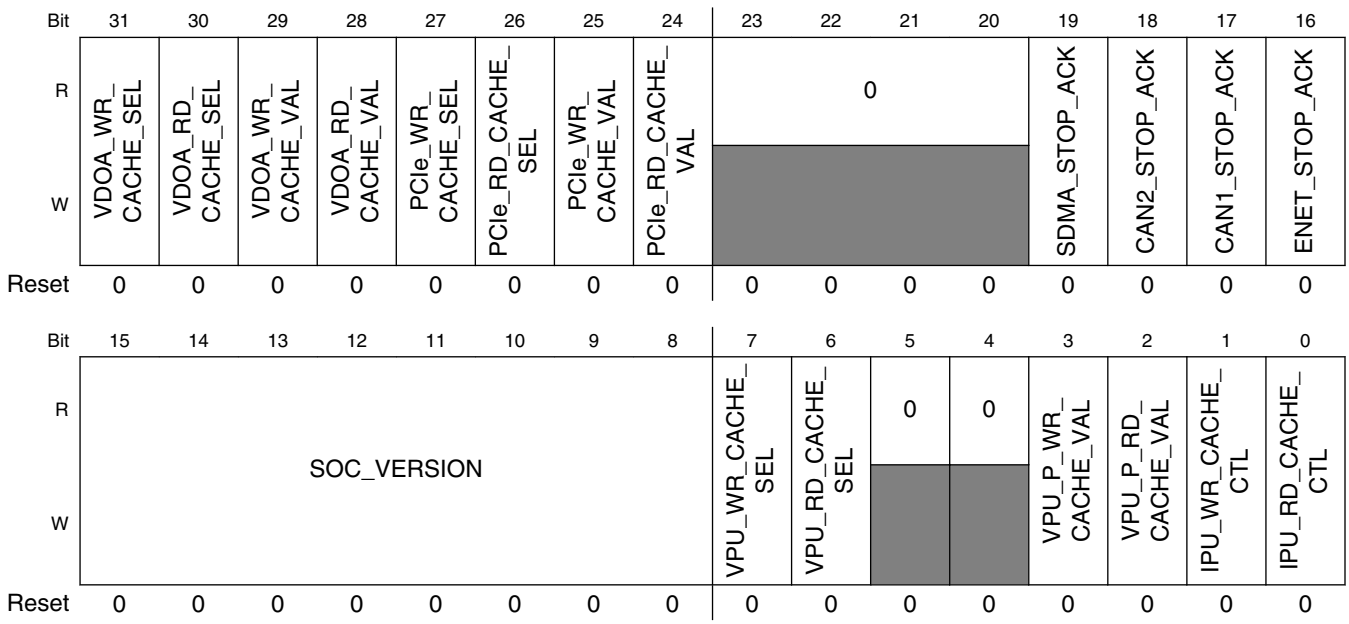
IOMUXC_GPR3 field descriptions (continued)

Field	Description
10 IPU_DIAG	IPU diagnostic debug bus mux 0 IPU1 diagnostic bus is selected 1 IPU2 diagnostic bus is selected
9–8 LVDS1_MUX_CTL	LVDS1 MUX control 00 LVDS1 source is IPU1 DI0 port 01 LVDS1 source is IPU1 DI1 port 10 LVDS1 source is IPU2 DI0 port 11 LVDS1 source is IPU2 DI1 port
7–6 LVDS0_MUX_CTL	LVDS0 MUX control 00 LVDS0 source is IPU1 DI0 port 01 LVDS0 source is IPU1 DI1 port 10 LVDS0 source is IPU2 DI0 port 11 LVDS0 source is IPU2 DI1 port
5–4 MIPI_MUX_CTL	MIPI MUX control 00 MIPI source is IPU1 DI0 port 01 MIPI source is IPU1 DI1 port 10 MIPI source is IPU2 DI0 port 11 MIPI source is IPU2 DI1 port
3–2 HDMI_MUX_CTL	HDMI MUX control 00 HDMI source is IPU1 DI0 port 01 HDMI source is IPU1 DI1 port 10 HDMI source is IPU2 DI0 port 11 HDMI source is IPU2 DI1 port
Reserved	This read-only field is reserved and always has the value 0.

1. Set of the cache bits, enable packet optimization through the bus system to DDR controller. The only side effect is that bus may change the nature of the accesses, which may lead to problems when accessing FIFO type address. In most typical cases, these bits should be set. For the GPU3D, GPU2D and OpenVG, such settings are possible through the IP programming model. For few peripherals, for these bits to take effect, it is required to also select set '1' to 'cache-mux' control bit.

36.4.5 GPR (IOMUXC_GPR4)

Address: 20E_0000h base + 10h offset = 20E_0010h



IOMUXC_GPR4 field descriptions

Field	Description
31 VDOA_WR_CACHE_SEL	This bit selects the cacheable attribute of VDOA AXI write transcations [1] 0 The write transactions cacheable attribute is driven by the VDOA core 1 The write transactions cacheable attribute is driven by VDOA_WR_CACHE_VAL.
30 VDOA_RD_CACHE_SEL	This bit selects the cacheable attribute of VDOA AXI read transcations) [1] 0 The read transaction cacheable attribute is driven by the VDOA core 1 The read transaction cacheable attribute is driven by VDOA_RD_CACHE_VAL.
29 VDOA_WR_CACHE_VAL	VDOA block cacheable attribute value of AXI write transactions The value of VDOA_WR_CACHE_VAL is affecting the transactions only if VDOA_WR_CACHE_SEL is set. [1] 0 Cacheable attribute is off for write transactions. 1 Cacheable attribute is on for write transactions.
28 VDOA_RD_CACHE_VAL	VDOA block cacheable attribute value of AXI read transactions The value of VDOA_RD_CACHE_VAL is affecting the transactions only if VDOA_RD_CACHE_SEL is set. [1] 0 Cacheable attribute is off for read transactions. 1 Cacheable attribute is on for read transactions.
27 PCIe_WR_CACHE_SEL	This bit selects the cacheable attribute of PCIe AXI write transcations [1]

Table continues on the next page...

IOMUXC_GPR4 field descriptions (continued)

Field	Description
	0 The write transactions cacheable attribute is driven by the PCIe core 1 The write transactions cacheable attribute is driven by PCIe_WR_CACHE_VAL.

IOMUXC_GPR8 field descriptions

Field	Description
31–25 PCS_TX_ SWING_LOW	PCIe_PHY - This static value sets the launch amplitude of the transmitter when pipe0_tx_swing is set to 1'b0 (default state). 7'hxx - TX launch amplitude swing_low value.
24–18 PCS_TX_ SWING_FULL	PCIe_PHY - This static value sets the Tx driver SWING_FULL value. 7'hxx - Gen2 TX SWING FULL value.
17–12 PCS_TX_ DEEMPH_ GEN2_6DB	PCIe_PHY - This static value sets the Tx driver de-emphasis value in the case where pipe0_tx_deemph is set to 1'b0 and the PHY is running at the Gen2 (6db) rate. 6'hxx - Gen2 (6db) De-emphasis value.
11–6 PCS_TX_ DEEMPH_ GEN2_3P5DB	PCIe_PHY - This static value sets the Tx driver de-emphasis value in the case where pipe0_tx_deemph is set to 1'b1 (the default setting) and the PHY is running at the Gen2 (3p5db) rate. 6'hxx - Gen2 De-emphasis value.
PCS_TX_ DEEMPH_GEN1	PCIe_PHY - This static value sets the Tx driver de-emphasis value in the case where pipe0_tx_deemph is set to 1'b1 (the default setting) and the PHY is running at the Gen1 rate. 6'hxx - Gen1 De-emphasis value.

36.4.10 GPR (IOMUXC_GPR9)

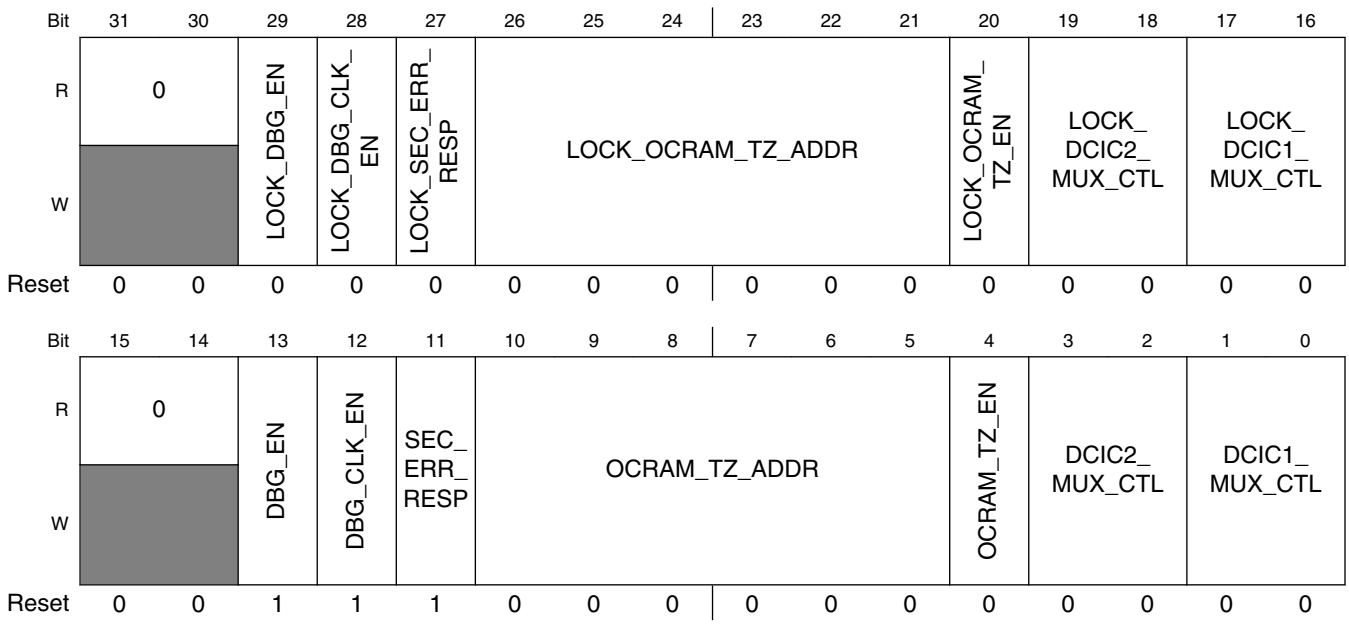
IOMUXC_GPR9 field descriptions

Field	Description
31–2 Reserved	This read-only field is reserved and always has the value 0.
1 TZASC2_BYP	TZASC-2 BYPASS MUX control 0 The TZASC-2 is bypassed and the transactions to DDR are not being checked. 1 The TZASC-2 is not bypassed and the transactions to DDR are being monitored / checked.
0 TZASC1_BYP	TZASC-1 BYPASS MUX control 0 The TZASC-1 is bypassed and the transactions to DDR are not being checked. 1 The TZASC-1 is not bypassed and the transactions to DDR are being monitored / checked.

36.4.11 GPR (IOMUXC_GPR10)

Address: 20E_0000h base + 28h offset = 20E_0028h



IOMUXC_GPR10 field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
29 LOCK_DBG_EN	Lock DBG_EN field for changes. This is a sticky field, once set it can't be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
28 LOCK_DBG_CLK_EN	Lock DBG_CLK_EN field for changes. This is a sticky field, once set it can't be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
27 LOCK_SEC_ERR_RESP	Lock SEC_ERR_RESP field for changes. This is a sticky field, once set it can't be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
26–21 LOCK_OCRAM_TZ_ADDR	Lock OCRAM_TZ_ADDR field for changes. This is a sticky field, once set it can't be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
20 LOCK_OCRAM_TZ_EN	Lock OCRAM_TZ_EN field for changes. This is a sticky field, once set it can't be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)

Table continues on the next page...

IOMUXC_GPR10 field descriptions (continued)

Field	Description
19–18 LOCK_DCIC2_ MUX_CTL	Lock DCIC2_MUX_CTL field for changes. This is a sticky field, once set it can't be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
17–16 LOCK_DCIC1_ MUX_CTL	Lock DCIC1_MUX_CTL field for changes. This is a sticky field, once set it can't be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
15–14 Reserved	This read-only field is reserved and always has the value 0.
13 DBG_EN	ARM non secure (non-invasive) debug enable 0 Debug turned off. 1 Debug enabled (default).
12 DBG_CLK_EN	ARM Debug clock enable 0 Debug turned off. 1 Debug enabled (default).
11 SEC_ERR_ RESP	Security error response enable for all security gaskets (on both AHB and AXI busses) 0 OKEY response 1 SLVError (default)
10–5 OCRAM_TZ_ ADDR	OCRAM TrustZone (TZ) start address. This is the start address of the secure memory region within the OCRAM memory space is 4KB granularity. The start address affects the OCRAM transactions only if OCRAM_TZ_EN bit is set. The OCRAM TZ ENDADDR is not configurable and is set to the end of OCRAM memory space.
4 OCRAM_TZ_EN	OCRAM TrustZone (TZ) enable. 0 The TrustZone feature is disabled. Entire OCRAM space is available for all access types (secure/non-secure/user/supervisor). 1 The TrustZone feature is enabled. Access to address in the range specified by [ENDADDR:STARTADDR] follows the execution mode access policy described in CSU chapter.
3–2 DCIC2_MUX_ CTL	DCIC-2 MUX control 00 DCIC-2 source is IPU1 DI1 port 01 DCIC-2 source is LVDS0 10 DCIC-2 source is LVDS1 11 DCIC-2 source is MIPI DPI
DCIC1_MUX_ CTL	DCIC-1 MUX control 00 DCIC-1 source is IPU1 or IPU2 DI0 port 01 DCIC-1 source is LVDS0 10 DCIC-1 source is LVDS1 11 DCIC-1 source is HDMI

IOMUXC_GPR12 field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 ARMP_IPG_ CLK_EN	ARM platform IPG clock enable 0 IPG clock is not running (gated). 1 IPG clock is running (enabled).
26 ARMP_AHB_ CLK_EN	ARM platform AHB clock enable 0 IPG clock is not running (gated). 1 IPG clock is running (enabled).
25 ARMP_ATB_ CLK_EN	ARM platform ATB clock enable 0 IPG clock is not running (gated). 1 IPG clock is running (enabled).
24 ARMP_APB_ CLK_EN	ARM platform APB clock enable 0 IPG clock is not running (gated). 1 IPG clock is running (enabled).
23–21 PCIe_CTL_7	PCIe control of diagnostic bus select (Drive 'cxpl_diag_ctrl' PCI controller input)
20–17 DIA_STATUS_ BUS_SELECT	PCIe_CTL - used for debug to select what part of diag_status_bus will be reflected on the 32 bits of the iomux
16 APPS_PM_ XMT_TURNOFF	PCIe_CTL - Request from the application to generate a PM_Turn_Off Message.
15–12 DEVICE_TYPE	PCIe_CTL - Device/Port Type. Indicates the specific type of this PCI Express Function (EP or RC) DEVICE_TYPE field values 0011-1111 are reserved. 0000 **PCIE_EP** — EP Mode 0010 **PCIE_RC** — RC Mode
11 APP_INIT_RST	PCIe_CTL - Request from the application to send a Hot Reset to the downstream device.
10 APP_LTSSM_ ENABLE	PCIe_CTL - Driven low by the application after reset to hold the LTSSM in the Detect state until the application is ready. When the application has finished initializing the core configuration registers, it asserts app_ltssm_enable to allow the LTSSM to continue Link establishment. 0 Application is not ready. 1 Application is ready.
9 APPS_PM_ XMT_PME	PCIe_CTL - Wake Up. Used by application logic to wake up the PMC state machine from a D1, D2 or D3 power state. Upon wake-up, the core sends a PM_PME Message
8–4 LOS_LEVEL	PCIe_PHY - Loss-of-Signal Detector Sensitivity Level Control Function: Sets the sensitivity level for the Loss-of-Signal detector. This signal must be set to 0x9
3–2 uSDHC_DBG_ MUX	uSDHC debug bus IO mux control '00' - uSDHC1 debug '01' - uSDHC2 debug

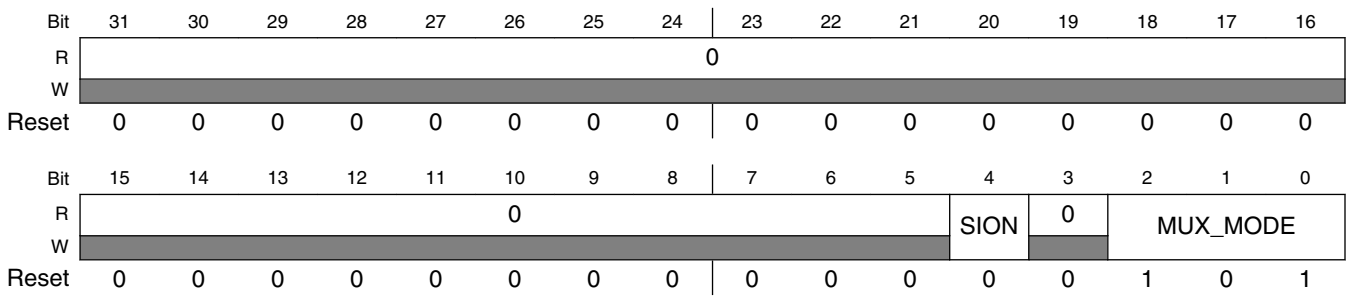
IOMUXC_SW_MUX_CTL_PAD_RGMII_RD0 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad RGMII_RD0. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 3 iomux modes to be used for pad: RGMII_RD0. NOTE: Pad RGMII_RD0 is involved in Daisy Chain. 000 **ALT0** — Select signal HSI_RX_READY. 001 **ALT1** — Select signal RGMII_RD0. - Configure register IOMUXC_ENET_MAC0_RX_DATA0_SELECT_INPUT for mode ALT1. 101 **ALT5** — Select signal GPIO6_IO25.

36.4.25 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_TX_CTL)

Address: 20E_0000h base + 74h offset = 20E_0074h

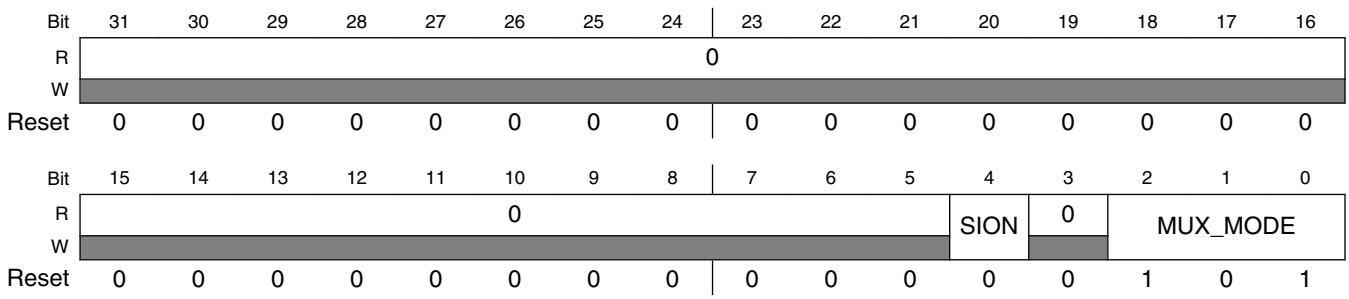


IOMUXC_SW_MUX_CTL_PAD_RGMII_TX_CTL field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad RGMII_TX_CTL. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 4 iomux modes to be used for pad: RGMII_TX_CTL. NOTE: Pad RGMII_TX_CTL is involved in Daisy Chain. 000 **ALT0** — Select signal USB_H2_STROBE. 001 **ALT1** — Select signal RGMII_TX_CTL. 101 **ALT5** — Select signal GPIO6_IO26. 111 **ALT7** — Select signal ENET_REF_CLK. - Configure register IOMUXC_ENET_REF_CLK_SELECT_INPUT for mode ALT7.

36.4.26 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_RD1)

Address: 20E_0000h base + 78h offset = 20E_0078h

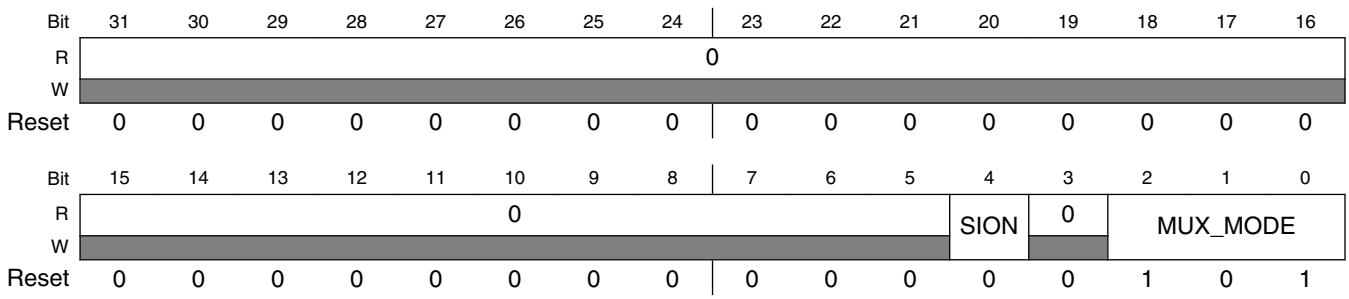


IOMUXC_SW_MUX_CTL_PAD_RGMII_RD1 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad RGMII_RD1. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 3 iomux modes to be used for pad: RGMII_RD1. NOTE: Pad RGMII_RD1 is involved in Daisy Chain. 000 **ALT0** — Select signal HSI_TX_FLAG. 001 **ALT1** — Select signal RGMII_RD1. - Configure register IOMUXC_ENET_MAC0_RX_DATA1_SELECT_INPUT for mode ALT1. 101 **ALT5** — Select signal GPIO6_IO27.

36.4.27 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_RD2)

Address: 20E_0000h base + 7Ch offset = 20E_007Ch

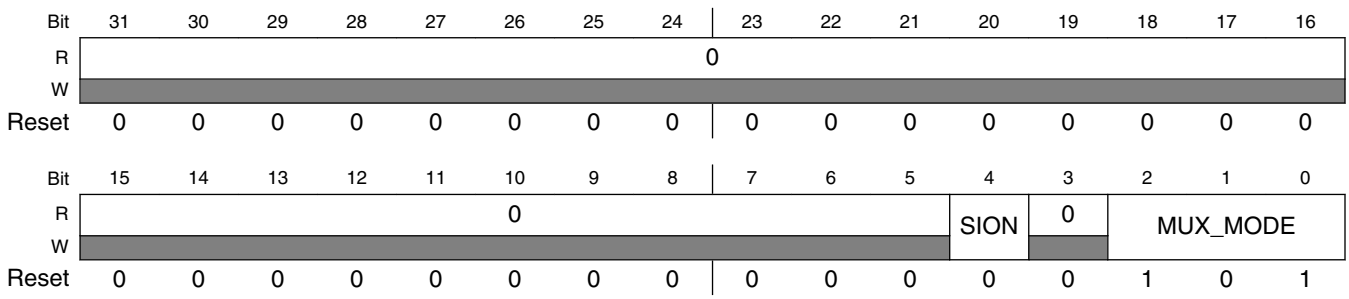


IOMUXC_SW_MUX_CTL_PAD_RGMII_RD2 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad RGMII_RD2. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 3 iomux modes to be used for pad: RGMII_RD2. NOTE: Pad RGMII_RD2 is involved in Daisy Chain. 000 **ALT0** — Select signal HSI_TX_DATA. 001 **ALT1** — Select signal RGMII_RD2. - Configure register IOMUXC_ENET_MAC0_RX_DATA2_SELECT_INPUT for mode ALT1. 101 **ALT5** — Select signal GPIO6_IO28.

36.4.28 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_RD3)

Address: 20E_0000h base + 80h offset = 20E_0080h

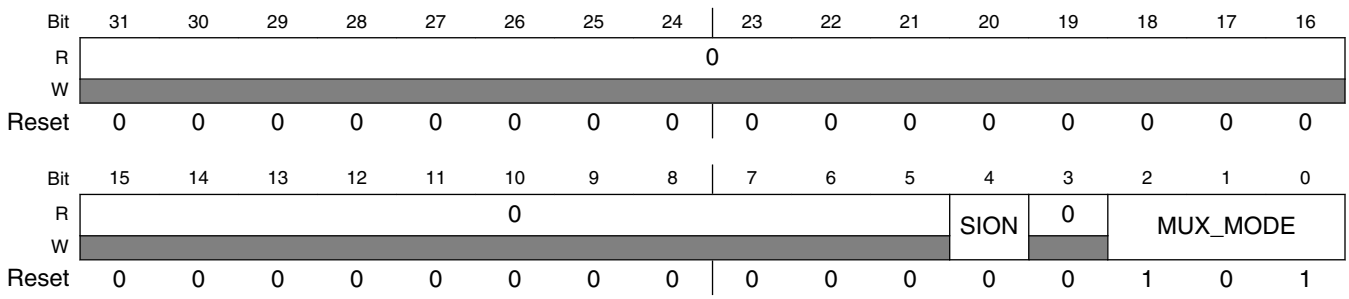


IOMUXC_SW_MUX_CTL_PAD_RGMII_RD3 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad RGMII_RD3. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 3 iomux modes to be used for pad: RGMII_RD3. NOTE: Pad RGMII_RD3 is involved in Daisy Chain. 000 **ALT0** — Select signal HSI_TX_WAKE. 001 **ALT1** — Select signal RGMII_RD3. - Configure register IOMUXC_ENET_MAC0_RX_DATA3_SELECT_INPUT for mode ALT1. 101 **ALT5** — Select signal GPIO6_IO29.

36.4.29 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_RGMII_RXC)

Address: 20E_0000h base + 84h offset = 20E_0084h



IOMUXC_SW_MUX_CTL_PAD_RGMII_RXC field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad RGMII_RXC. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 3 iomux modes to be used for pad: RGMII_RXC. NOTE: Pad RGMII_RXC is involved in Daisy Chain. 000 **ALT0** — Select signal USB_H3_STROBE. 001 **ALT1** — Select signal RGMII_RXC. - Configure register IOMUXC_ENET_MAC0_RX_CLK_SELECT_INPUT for mode ALT1. 101 **ALT5** — Select signal GPIO6_IO30.

36.4.30 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_ADDR25)

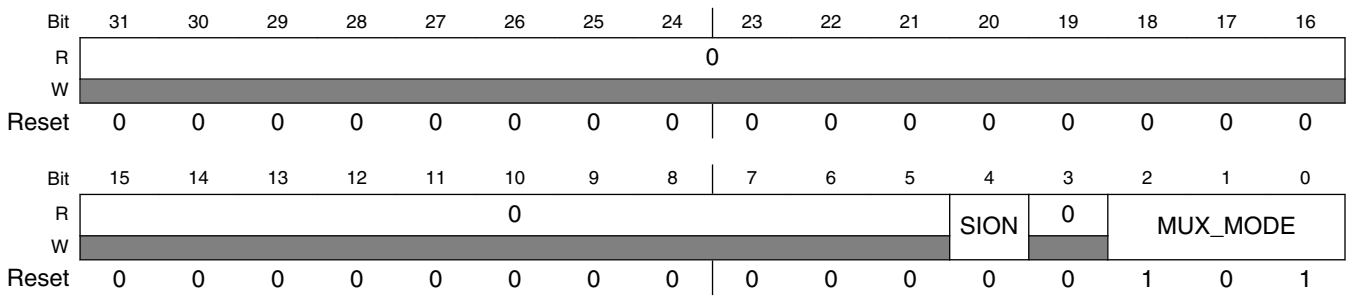
Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_A25. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 7 iomux modes to be used for pad: EIM_A25. NOTE: Pad EIM_A25 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_ADDR25. 001 **ALT1** — Select signal ECSPI4_SS1. 010 **ALT2** — Select signal ECSPI2_RDY. 011 **ALT3** — Select signal IPU1_DI1_PIN12. 100 **ALT4** — Select signal IPU1_DI0_D1_CS. 101 **ALT5** — Select signal GPIO5_IO02. 110 **ALT6** — Select signal HDMI_TX_CEC_LINE. - Configure register IOMUXC_HDMI_ICECIN_SELECT_INPUT for mode ALT6.

36.4.31 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_EB2_B)

Address: 20E_0000h base + 8Ch offset = 20E_008Ch

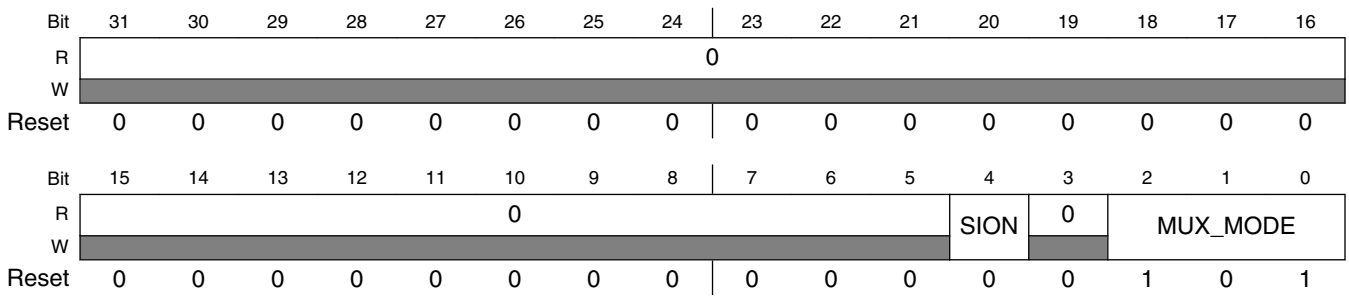


IOMUXC_SW_MUX_CTL_PAD_EIM_EB2_B field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_EB2. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 7 iomux modes to be used for pad: EIM_EB2. NOTE: Pad EIM_EB2 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_EB2_B. 001 **ALT1** — Select signal ECSPI1_SS0. - Configure register IOMUXC_ECSPI1_SS0_SELECT_INPUT for mode ALT1. 011 **ALT3** — Select signal IPU2_CSI1_DATA19. - Configure register IOMUXC_IPU2_SENS1_DATA19_SELECT_INPUT for mode ALT3. 100 **ALT4** — Select signal HDMI_TX_DDC_SCL. - Configure register IOMUXC_HDMI_II2C_CLKIN_SELECT_INPUT for mode ALT4. 101 **ALT5** — Select signal GPIO2_IO30. 110 **ALT6** — Select signal I2C2_SCL. - Configure register IOMUXC_I2C2_SCL_IN_SELECT_INPUT for mode ALT6. 111 **ALT7** — Select signal SRC_BOOT_CFG30.

36.4.32 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_DATA16)

Address: 20E_0000h base + 90h offset = 20E_0090h

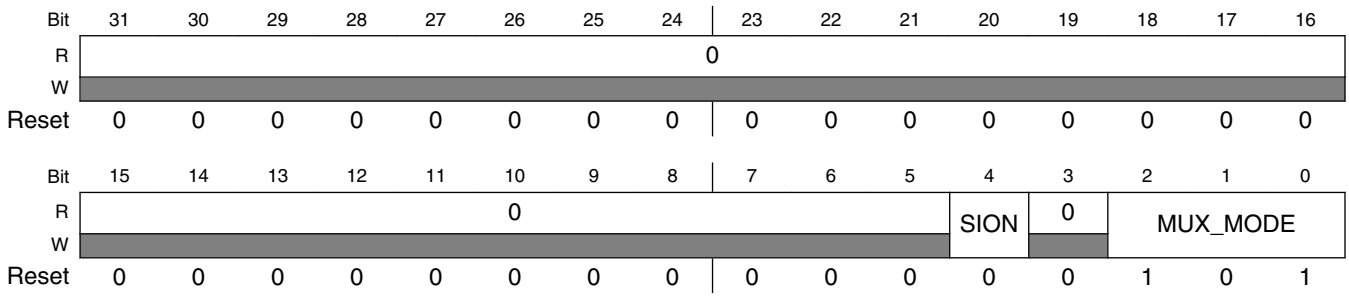


IOMUXC_SW_MUX_CTL_PAD_EIM_DATA16 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_D16. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 7 iomux modes to be used for pad: EIM_D16. NOTE: Pad EIM_D16 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_DATA16. 001 **ALT1** — Select signal ECSPI1_SCLK. - Configure register IOMUXC_ECSPI1_CSPI_CLK_IN_SELECT_INPUT for mode ALT1. 010 **ALT2** — Select signal IPU1_DI0_PIN05. 011 **ALT3** — Select signal IPU2_CSI1_DATA18. - Configure register IOMUXC_IPU2_SENS1_DATA18_SELECT_INPUT for mode ALT3. 100 **ALT4** — Select signal HDMI_TX_DDC_SDA. - Configure register IOMUXC_HDMI_II2C_DATAIN_SELECT_INPUT for mode ALT4. 101 **ALT5** — Select signal GPIO3_IO16. 110 **ALT6** — Select signal I2C2_SDA. - Configure register IOMUXC_I2C2_SDA_IN_SELECT_INPUT for mode ALT6.

36.4.33 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_DATA17)

Address: 20E_0000h base + 94h offset = 20E_0094h

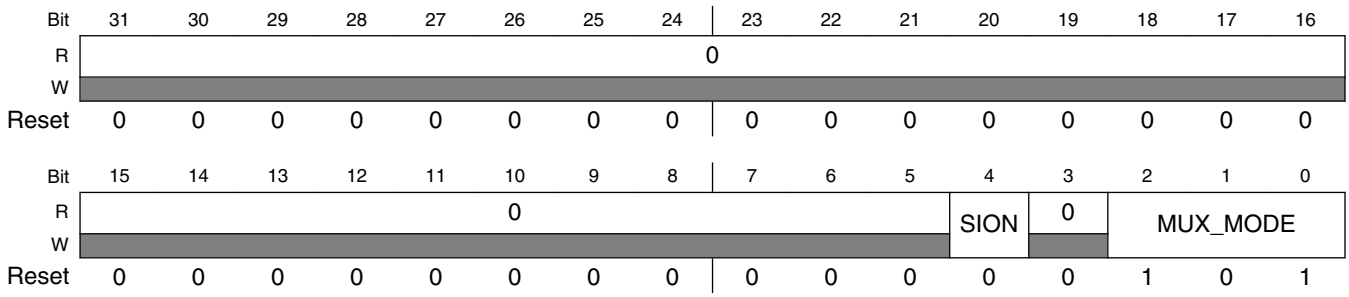


IOMUXC_SW_MUX_CTL_PAD_EIM_DATA17 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_D17. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 7 iomux modes to be used for pad: EIM_D17. NOTE: Pad EIM_D17 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_DATA17. 001 **ALT1** — Select signal ECSPI1_MISO. - Configure register IOMUXC_ECSPI1_MISO_SELECT_INPUT for mode ALT1. 010 **ALT2** — Select signal IPU1_DI0_PIN06. 011 **ALT3** — Select signal IPU2_CSI1_PIXCLK. - Configure register IOMUXC_IPU2_SENS1_PIX_CLK_SELECT_INPUT for mode ALT3. 100 **ALT4** — Select signal DCIC1_OUT. 101 **ALT5** — Select signal GPIO3_IO17. 110 **ALT6** — Select signal I2C3_SCL. - Configure register IOMUXC_I2C3_SCL_IN_SELECT_INPUT for mode ALT6.

36.4.34 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_DATA18)

Address: 20E_0000h base + 98h offset = 20E_0098h

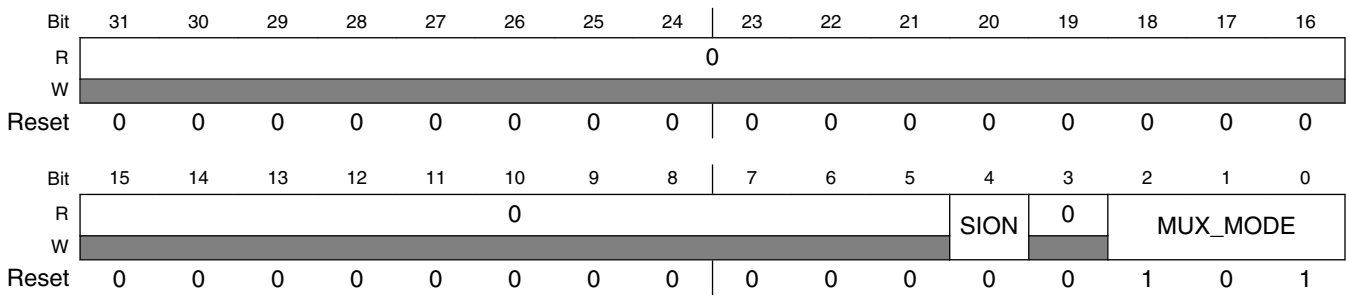


IOMUXC_SW_MUX_CTL_PAD_EIM_DATA18 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_D18. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 7 iomux modes to be used for pad: EIM_D18. NOTE: Pad EIM_D18 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_DATA18. 001 **ALT1** — Select signal ECSPI1_MOSI. - Configure register IOMUXC_ECSPI1_MOSI_SELECT_INPUT for mode ALT1. 010 **ALT2** — Select signal IPU1_DI0_PIN07. 011 **ALT3** — Select signal IPU2_CSI1_DATA17. - Configure register IOMUXC_IPU2_SENS1_DATA17_SELECT_INPUT for mode ALT3. 100 **ALT4** — Select signal IPU1_DI1_D0_CS. 101 **ALT5** — Select signal GPIO3_IO18. 110 **ALT6** — Select signal I2C3_SDA. - Configure register IOMUXC_I2C3_SDA_IN_SELECT_INPUT for mode ALT6.

36.4.35 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_DATA19)

Address: 20E_0000h base + 9Ch offset = 20E_009Ch

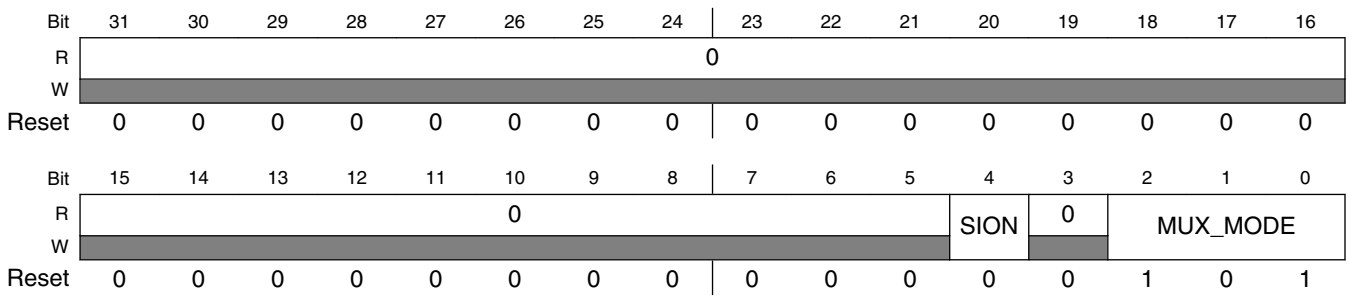


IOMUXC_SW_MUX_CTL_PAD_EIM_DATA19 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_D19. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 7 iomux modes to be used for pad: EIM_D19. NOTE: Pad EIM_D19 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_DATA19. 001 **ALT1** — Select signal ECSPI1_SS1. - Configure register IOMUXC_ECSPI1_SS1_SELECT_INPUT for mode ALT1. 010 **ALT2** — Select signal IPU1_DI0_PIN08. 011 **ALT3** — Select signal IPU2_CSI1_DATA16. - Configure register IOMUXC_IPU2_SENS1_DATA16_SELECT_INPUT for mode ALT3. 100 **ALT4** — Select signal UART1_CTS_B. - Configure register IOMUXC_UART1_UART_RTS_B_SELECT_INPUT for mode ALT4. 101 **ALT5** — Select signal GPIO3_IO19. 110 **ALT6** — Select signal EPIT1_OUT.

36.4.36 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_DATA20)

Address: 20E_0000h base + A0h offset = 20E_00A0h

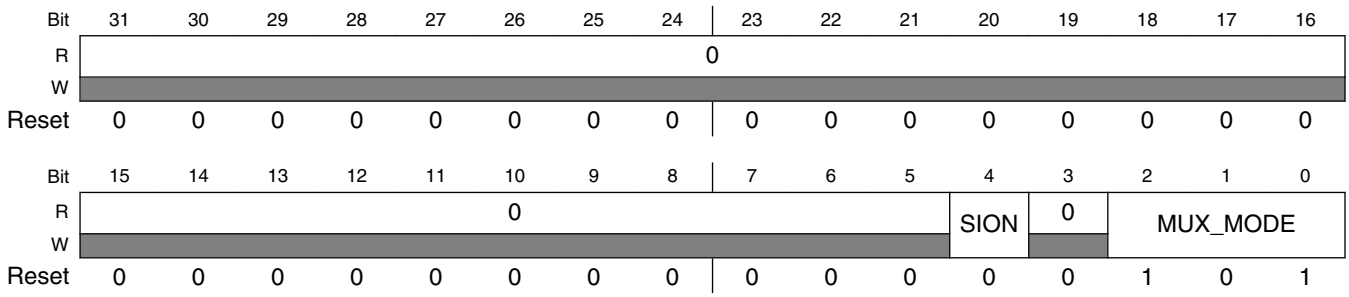


IOMUXC_SW_MUX_CTL_PAD_EIM_DATA20 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_D20. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 7 iomux modes to be used for pad: EIM_D20. NOTE: Pad EIM_D20 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_DATA20. 001 **ALT1** — Select signal ECSPI4_SS0. - Configure register IOMUXC_ECSPI4_SS0_SELECT_INPUT for mode ALT1. 010 **ALT2** — Select signal IPU1_DI0_PIN16. 011 **ALT3** — Select signal IPU2_CSI1_DATA15. - Configure register IOMUXC_IPU2_SENS1_DATA15_SELECT_INPUT for mode ALT3. 100 **ALT4** — Select signal UART1_RTS_B. - Configure register IOMUXC_UART1_UART_RTS_B_SELECT_INPUT for mode ALT4. 101 **ALT5** — Select signal GPIO3_IO20. 110 **ALT6** — Select signal EPIT2_OUT.

36.4.37 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_DATA21)

Address: 20E_0000h base + A4h offset = 20E_00A4h



IOMUXC_SW_MUX_CTL_PAD_EIM_DATA21 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_D21. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 8 iomux modes to be used for pad: EIM_D21. NOTE: Pad EIM_D21 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_DATA21. 001 **ALT1** — Select signal ECSPI4_SCLK. 010 **ALT2** — Select signal IPU1_DI0_PIN17. 011 **ALT3** — Select signal IPU2_CSI1_DATA11. - Configure register IOMUXC_IPU2_SENS1_DATA11_SELECT_INPUT for mode ALT3. 100 **ALT4** — Select signal USB_OTG_OC. - Configure register IOMUXC_USB_OTG_OC_SELECT_INPUT for mode ALT4. 101 **ALT5** — Select signal GPIO3_IO21. 110 **ALT6** — Select signal I2C1_SCL. - Configure register IOMUXC_I2C1_SCL_IN_SELECT_INPUT for mode ALT6. 111 **ALT7** — Select signal SPDIF_IN. - Configure register IOMUXC_SPDIF_SPDIF_IN1_SELECT_INPUT for mode ALT7.

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
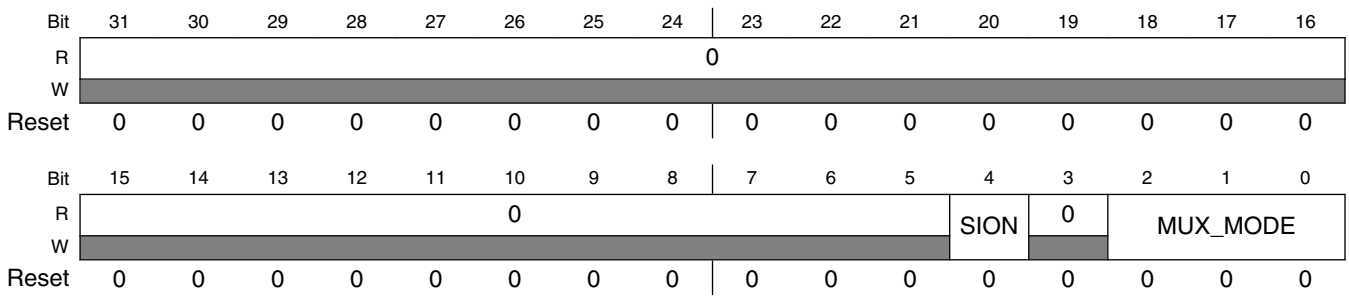
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_A19. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 5 iomux modes to be used for pad: EIM_A19. NOTE: Pad EIM_A19 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_ADDR19. 001 **ALT1** — Select signal IPU1_DISP1_DATA14. 010 **ALT2** — Select signal IPU2_CSI1_DATA14. - Configure register IOMUXC_IPU2_SENS1_DATA14_SELECT_INPUT for mode ALT2. 101 **ALT5** — Select signal GPIO2_IO19. 111 **ALT7** — Select signal SRC_BOOT_CFG19.

36.4.55 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_ADDR18)

Address: 20E_0000h base + ECh offset = 20E_00ECh

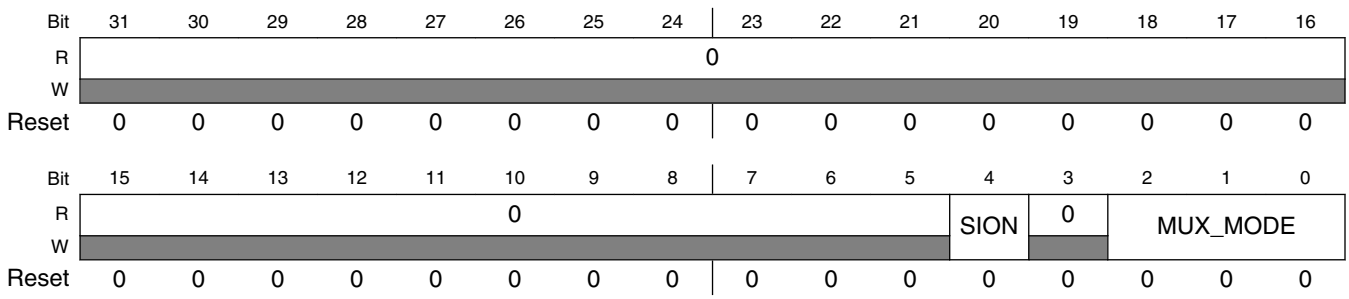


IOMUXC_SW_MUX_CTL_PAD_EIM_ADDR18 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_A18. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 5 iomux modes to be used for pad: EIM_A18. NOTE: Pad EIM_A18 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_ADDR18. 001 **ALT1** — Select signal IPU1_DISP1_DATA13. 010 **ALT2** — Select signal IPU2_CSI1_DATA13. - Configure register IOMUXC_IPU2_SENS1_DATA13_SELECT_INPUT for mode ALT2. 101 **ALT5** — Select signal GPIO2_IO20. 111 **ALT7** — Select signal SRC_BOOT_CFG18.

36.4.56 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_ADDR17)

Address: 20E_0000h base + F0h offset = 20E_00F0h

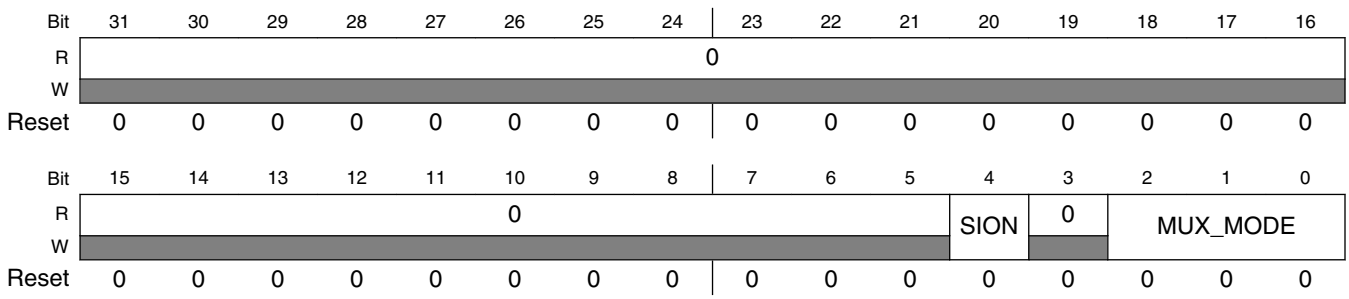


IOMUXC_SW_MUX_CTL_PAD_EIM_ADDR17 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_A17. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 5 iomux modes to be used for pad: EIM_A17. NOTE: Pad EIM_A17 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_ADDR17. 001 **ALT1** — Select signal IPU1_DISP1_DATA12. 010 **ALT2** — Select signal IPU2_CSI1_DATA12. - Configure register IOMUXC_IPU2_SENS1_DATA12_SELECT_INPUT for mode ALT2. 101 **ALT5** — Select signal GPIO2_IO21. 111 **ALT7** — Select signal SRC_BOOT_CFG17.

36.4.57 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_ADDR16)

Address: 20E_0000h base + F4h offset = 20E_00F4h

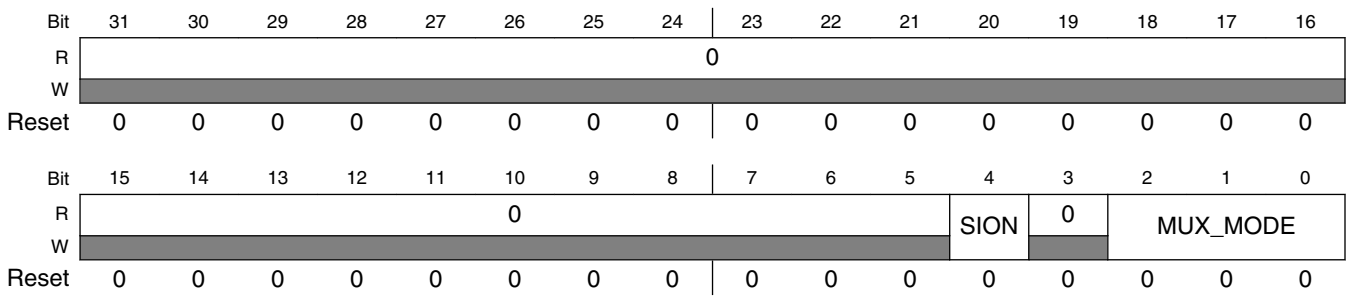


IOMUXC_SW_MUX_CTL_PAD_EIM_ADDR16 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_A16. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 5 iomux modes to be used for pad: EIM_A16. NOTE: Pad EIM_A16 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_ADDR16. 001 **ALT1** — Select signal IPU1_DI1_DISP_CLK. 010 **ALT2** — Select signal IPU2_CSI1_PIXCLK. - Configure register IOMUXC_IPU2_SENS1_PIX_CLK_SELECT_INPUT for mode ALT2. 101 **ALT5** — Select signal GPIO2_IO22. 111 **ALT7** — Select signal SRC_BOOT_CFG16.

36.4.58 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_CS0_B)

Address: 20E_0000h base + F8h offset = 20E_00F8h

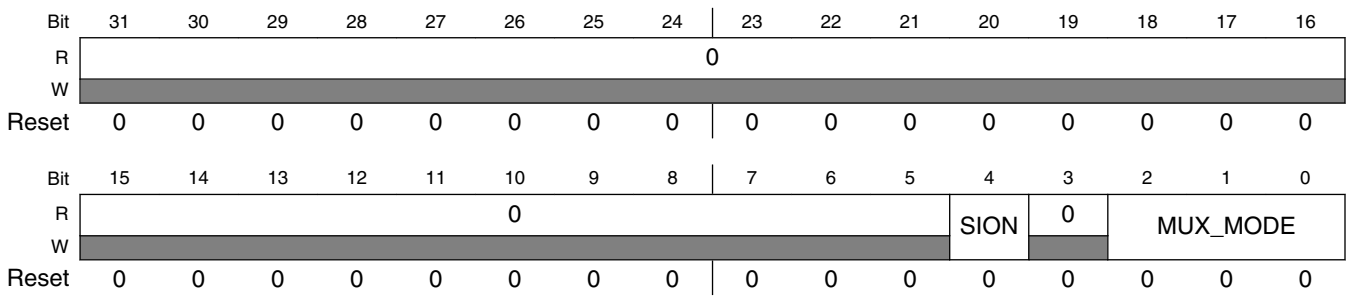


IOMUXC_SW_MUX_CTL_PAD_EIM_CS0_B field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_CS0. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 4 iomux modes to be used for pad: EIM_CS0. NOTE: Pad EIM_CS0 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_CS0_B. 001 **ALT1** — Select signal IPU1_DI1_PIN05. 010 **ALT2** — Select signal ECSPI2_SCLK. - Configure register IOMUXC_ECSPI2_CSPI_CLK_IN_SELECT_INPUT for mode ALT2. 101 **ALT5** — Select signal GPIO2_IO23.

36.4.59 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_CS1_B)

Address: 20E_0000h base + FCh offset = 20E_00FCh



IOMUXC_SW_MUX_CTL_PAD_EIM_CS1_B field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_CS1. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 4 iomux modes to be used for pad: EIM_CS1. NOTE: Pad EIM_CS1 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_CS1_B. 001 **ALT1** — Select signal IPU1_DI1_PIN06. 010 **ALT2** — Select signal ECSPI2_MOSI. - Configure register IOMUXC_ECSPI2_MOSI_SELECT_INPUT for mode ALT2. 101 **ALT5** — Select signal GPIO2_IO24.

36.4.60 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_OE_B)

Address: 20E_0000h base + 100h offset = 20E_0100h

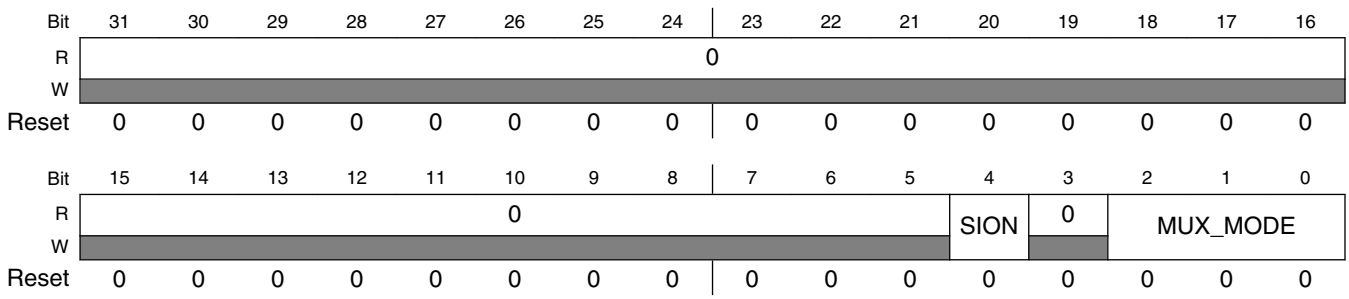
Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_OE. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 4 iomux modes to be used for pad: EIM_OE. NOTE: Pad EIM_OE is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_OE_B. 001 **ALT1** — Select signal IPU1_DI1_PIN07. 010 **ALT2** — Select signal ECSPI2_MISO. - Configure register IOMUXC_ECSPI2_MISO_SELECT_INPUT for mode ALT2. 101 **ALT5** — Select signal GPIO2_IO25.

36.4.61 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_RW)

Address: 20E_0000h base + 104h offset = 20E_0104h

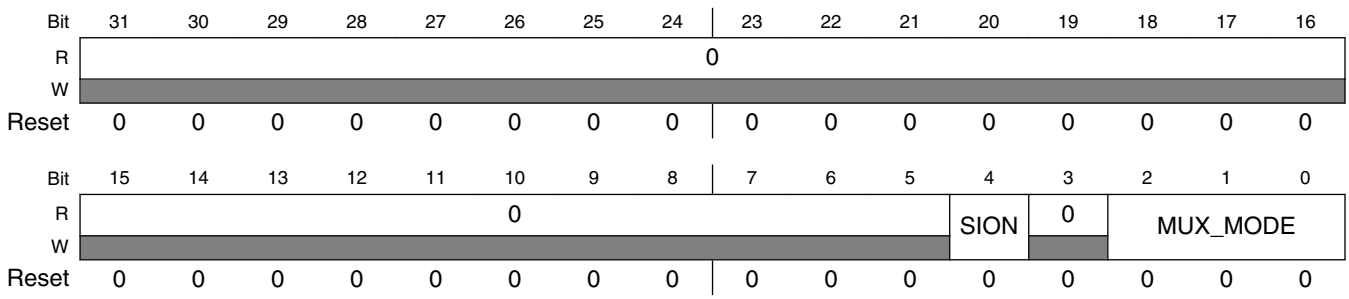


IOMUXC_SW_MUX_CTL_PAD_EIM_RW field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_RW. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 5 iomux modes to be used for pad: EIM_RW. NOTE: Pad EIM_RW is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_RW. 001 **ALT1** — Select signal IPU1_DI1_PIN08. 010 **ALT2** — Select signal ECSPI2_SS0. - Configure register IOMUXC_ECSPI2_SS0_SELECT_INPUT for mode ALT2. 101 **ALT5** — Select signal GPIO2_IO26. 111 **ALT7** — Select signal SRC_BOOT_CFG29.

36.4.62 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_LBA_B)

Address: 20E_0000h base + 108h offset = 20E_0108h

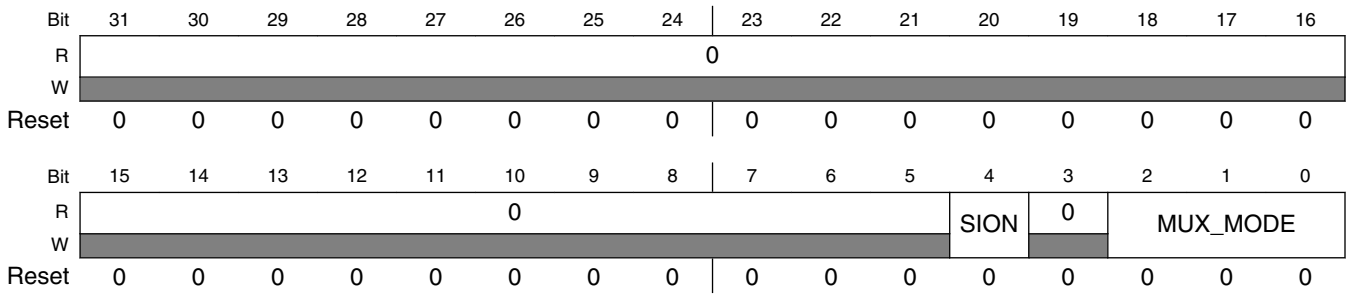


IOMUXC_SW_MUX_CTL_PAD_EIM_LBA_B field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_LBA. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 5 iomux modes to be used for pad: EIM_LBA. NOTE: Pad EIM_LBA is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_LBA_B. 001 **ALT1** — Select signal IPU1_DI1_PIN17. 010 **ALT2** — Select signal ECSPI2_SS1. - Configure register IOMUXC_ECSPI2_SS1_SELECT_INPUT for mode ALT2. 101 **ALT5** — Select signal GPIO2_IO27. 111 **ALT7** — Select signal SRC_BOOT_CFG26.

36.4.63 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_EB0_B)

Address: 20E_0000h base + 10Ch offset = 20E_010Ch

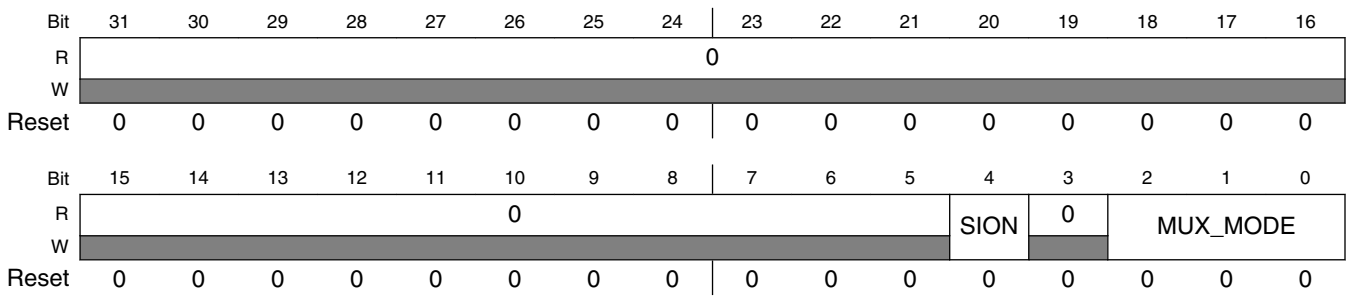


IOMUXC_SW_MUX_CTL_PAD_EIM_EB0_B field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_EB0. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 6 iomux modes to be used for pad: EIM_EB0. NOTE: Pad EIM_EB0 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_EB0_B. 001 **ALT1** — Select signal IPU1_DISP1_DATA11. 010 **ALT2** — Select signal IPU2_CSI1_DATA11. - Configure register IOMUXC_IPU2_SENS1_DATA11_SELECT_INPUT for mode ALT2. 100 **ALT4** — Select signal CCM_PMIC_READY. - Configure register IOMUXC_CCM_PMIC_READY_SELECT_INPUT for mode ALT4. 101 **ALT5** — Select signal GPIO2_IO28. 111 **ALT7** — Select signal SRC_BOOT_CFG27.

36.4.64 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_EB1_B)

Address: 20E_0000h base + 110h offset = 20E_0110h

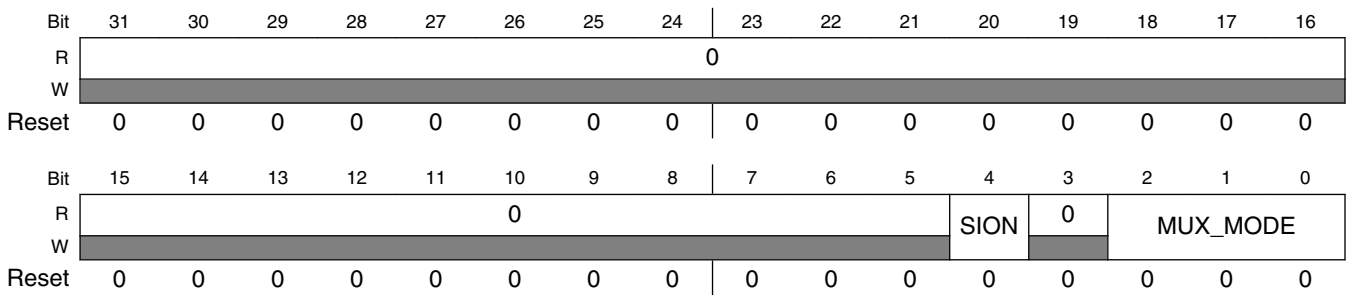


IOMUXC_SW_MUX_CTL_PAD_EIM_EB1_B field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_EB1. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 5 iomux modes to be used for pad: EIM_EB1. NOTE: Pad EIM_EB1 is involved in Daisy Chain. 000 **ALT0** — Select signal EIM_EB1_B. 001 **ALT1** — Select signal IPU1_DISP1_DATA10. 010 **ALT2** — Select signal IPU2_CSI1_DATA10. - Configure register IOMUXC_IPU2_SENS1_DATA10_SELECT_INPUT for mode ALT2. 101 **ALT5** — Select signal GPIO2_IO29. 111 **ALT7** — Select signal SRC_BOOT_CFG28.

36.4.65 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_AD00)

Address: 20E_0000h base + 114h offset = 20E_0114h

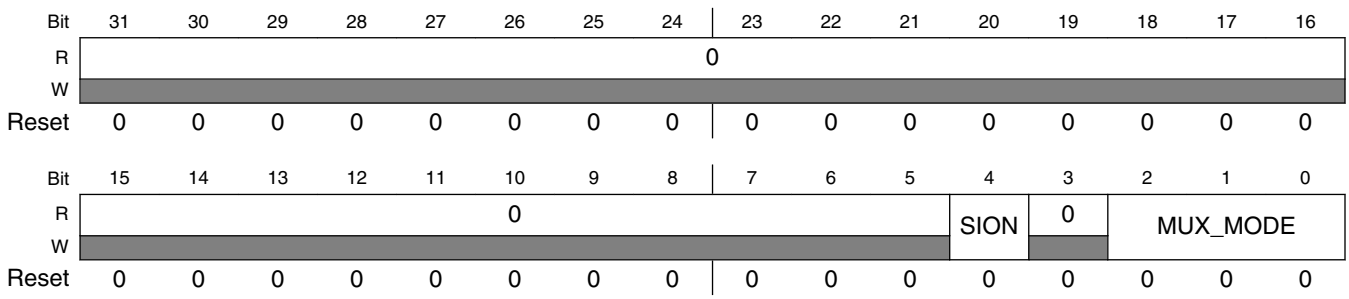


IOMUXC_SW_MUX_CTL_PAD_EIM_AD00 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_DA0. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 5 iomux modes to be used for pad: EIM_DA0. 000 **ALT0** — Select signal EIM_AD00. 001 **ALT1** — Select signal IPU1_DISP1_DATA09. 010 **ALT2** — Select signal IPU2_CSI1_DATA09. 101 **ALT5** — Select signal GPIO3_IO00. 111 **ALT7** — Select signal SRC_BOOT_CFG00.

36.4.66 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_AD01)

Address: 20E_0000h base + 118h offset = 20E_0118h



IOMUXC_SW_MUX_CTL_PAD_EIM_AD01 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad EIM_DA1. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 5 iomux modes to be used for pad: EIM_DA1. 000 **ALT0** — Select signal EIM_AD01. 001 **ALT1** — Select signal IPU1_DISP1_DATA08. 010 **ALT2** — Select signal IPU2_CSI1_DATA08. 101 **ALT5** — Select signal GPIO3_IO01. 111 **ALT7** — Select signal SRC_BOOT_CFG01.

36.4.67 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EIM_AD02)

Address: 20E_0000h base + 11Ch offset = 20E_011Ch

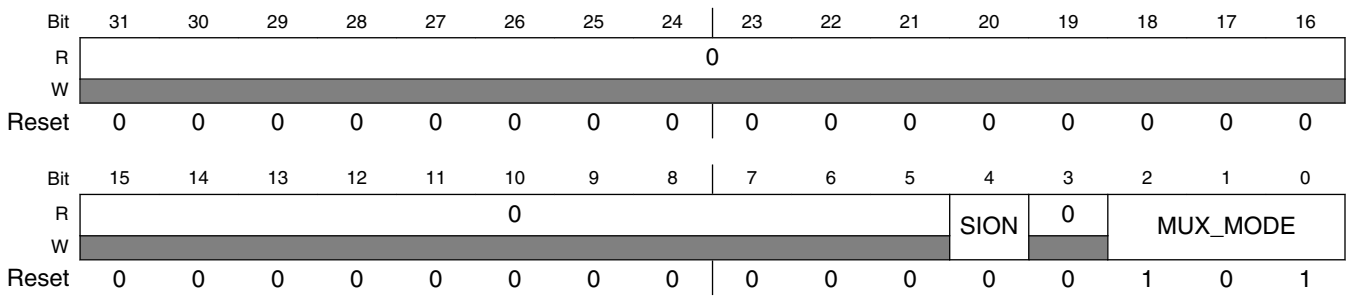
IOMUXC_SW_MUX_CTL_PAD_GPIO07 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad GPIO_7. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 8 iomux modes to be used for pad: GPIO_7. NOTE: Pad GPIO_7 is involved in Daisy Chain. 000 **ALT0** — Select signal ESAI_TX4_RX1. - Configure register IOMUXC_ESAI_SDO4_SDI1_SELECT_INPUT for mode ALT0. 001 **ALT1** — Select signal ECSPI5_RDY. 010 **ALT2** — Select signal EPIT1_OUT. 011 **ALT3** — Select signal FLEXCAN1_TX. 100 **ALT4** — Select signal UART2_TX_DATA. - Configure register IOMUXC_UART2_UART_RX_DATA_SELECT_INPUT for mode ALT4. 101 **ALT5** — Select signal GPIO1_IO07. 110 **ALT6** — Select signal SPDIF_LOCK. 111 **ALT7** — Select signal USB_OTG_HOST_MODE.

36.4.141 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO08)

Address: 20E_0000h base + 244h offset = 20E_0244h



IOMUXC_SW_MUX_CTL_PAD_GPIO08 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 **ENABLED** — Force input path of pad GPIO_8. 0 **DISABLED** — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 8 iomux modes to be used for pad: GPIO_8. NOTE: Pad GPIO_8 is involved in Daisy Chain. 000 **ALT0** — Select signal ESAI_TX5_RX0. - Configure register IOMUXC_ESAI_SDO5_SDI0_SELECT_INPUT for mode ALT0. 001 **ALT1** — Select signal XTALOSC_REF_CLK_32K. 010 **ALT2** — Select signal EPIT2_OUT. 011 **ALT3** — Select signal FLEXCAN1_RX. - Configure register IOMUXC_FLEXCAN1_RX_SELECT_INPUT for mode ALT3. 100 **ALT4** — Select signal UART2_RX_DATA. - Configure register IOMUXC_UART2_UART_RX_DATA_SELECT_INPUT for mode ALT4. 101 **ALT5** — Select signal GPIO1_IO08. 110 **ALT6** — Select signal SPDIF_SR_CLK. 111 **ALT7** — Select signal USB_OTG_PWR_CTL_WAKE.

36.4.142 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO16)

Address: 20E_0000h base + 248h offset = 20E_0248h

IOMUXC_SW_PAD_CTL_PAD_RGMII_TD2 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE_RGMII Note: The value of this field does not reflect the value of the Group Control Register.
17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: RGMII_TD2. 0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: RGMII_TD2.

Table continues on the next page...

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE_RGMII Note: The value of this field does not reflect the value of the Group Control Register.
17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: RGMII_RD3. 0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: RGMII_RD3. 00 **100K_OHM_PD** — 100K Ohm Pull Down 01 **47K_OHM_PU** — 47K Ohm Pull Up 10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: RGMII_RD3. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: RGMII_RD3.

IOMUXC_SW_PAD_CTL_PAD_EIM_DATA25 field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: EIM_D25. 0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: EIM_D25. 00 **100K_OHM_PD** — 100K Ohm Pull Down 01 **47K_OHM_PU** — 47K Ohm Pull Up 10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: EIM_D25. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: EIM_D25.

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_EIM_DATA25 field descriptions (continued)

Field	Description
	0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: EIM_D25. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 **90_OHM** — 50 Ohm @ 3.3V, 90 Ohm @ 1.8V 100 **60_OHM** — 37 Ohm @ 3.3V, 60 Ohm @ 1.8V 101 **50_OHM** — 30 Ohm @ 3.3V, 50 Ohm @ 1.8V 110 **40_OHM** — 25 Ohm @ 3.3V, 40 Ohm @ 1.8V 111 **33_OHM** — 20 Ohm @ 3.3V, 33 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 0 **SLOW** — Slow Slew Rate 1 **FAST** — Fast Slew Rate

IOMUXC_SW_PAD_CTL_PAD_EIM_AD05 field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: EIM_DA5. 0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: EIM_DA5. 00 **100K_OHM_PD** — 100K Ohm Pull Down 01 **47K_OHM_PU** — 47K Ohm Pull Up 10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: EIM_DA5. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: EIM_DA5.

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_EIM_AD05 field descriptions (continued)

Field	Description
	0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: EIM_DA5. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 **90_OHM** — 50 Ohm @ 3.3V, 90 Ohm @ 1.8V 100 **60_OHM** — 37 Ohm @ 3.3V, 60 Ohm @ 1.8V 101 **50_OHM** — 30 Ohm @ 3.3V, 50 Ohm @ 1.8V 110 **40_OHM** — 25 Ohm @ 3.3V, 40 Ohm @ 1.8V 111 **33_OHM** — 20 Ohm @ 3.3V, 33 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 0 **SLOW** — Slow Slew Rate 1 **FAST** — Fast Slew Rate

36.4.268 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_EIM_AD06)

Address: 20E_0000h base + 440h offset = 20E_0440h

IOMUXC_SW_PAD_CTL_PAD_DISP0_DATA02 field descriptions (continued)

Field	Description
	0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: DISP0_DAT2. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 **90_OHM** — 50 Ohm @ 3.3V, 90 Ohm @ 1.8V 100 **60_OHM** — 37 Ohm @ 3.3V, 60 Ohm @ 1.8V 101 **50_OHM** — 30 Ohm @ 3.3V, 50 Ohm @ 1.8V 110 **40_OHM** — 25 Ohm @ 3.3V, 40 Ohm @ 1.8V 111 **33_OHM** — 20 Ohm @ 3.3V, 33 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 0 **SLOW** — Slow Slew Rate 1 **FAST** — Fast Slew Rate

IOMUXC_SW_PAD_CTL_PAD_DISP0_DATA09 field descriptions (continued)

Field	Description
	10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: DISP0_DAT9. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: DISP0_DAT9. 0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: DISP0_DAT9. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 **90_OHM** — 50 Ohm @ 3.3V, 90 Ohm @ 1.8V 100 **60_OHM** — 37 Ohm @ 3.3V, 60 Ohm @ 1.8V 101 **50_OHM** — 30 Ohm @ 3.3V, 50 Ohm @ 1.8V 110 **40_OHM** — 25 Ohm @ 3.3V, 40 Ohm @ 1.8V 111 **33_OHM** — 20 Ohm @ 3.3V, 33 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details.

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DISP0_DAT23. 0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: DISP0_DAT23. 00 **100K_OHM_PD** — 100K Ohm Pull Down 01 **47K_OHM_PU** — 47K Ohm Pull Up 10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: DISP0_DAT23. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: DISP0_DAT23. 0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.

IOMUXC_SW_PAD_CTL_PAD_DISP0_DATA23 field descriptions (continued)

Field	Description
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: DISP0_DAT23. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 **90_OHM** — 50 Ohm @ 3.3V, 90 Ohm @ 1.8V 100 **60_OHM** — 37 Ohm @ 3.3V, 60 Ohm @ 1.8V 101 **50_OHM** — 30 Ohm @ 3.3V, 50 Ohm @ 1.8V 110 **40_OHM** — 25 Ohm @ 3.3V, 40 Ohm @ 1.8V 111 **33_OHM** — 20 Ohm @ 3.3V, 33 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 0 **SLOW** — Slow Slew Rate 1 **FAST** — Fast Slew Rate

IOMUXC_SW_PAD_CTL_PAD_ENET_TX_EN field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: ENET_TX_EN. 0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: ENET_TX_EN. 00 **100K_OHM_PD** — 100K Ohm Pull Down 01 **47K_OHM_PU** — 47K Ohm Pull Up 10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: ENET_TX_EN. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: ENET_TX_EN.

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_ENET_TX_EN field descriptions (continued)

Field	Description
	0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: ENET_TX_EN. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 **90_OHM** — 50 Ohm @ 3.3V, 90 Ohm @ 1.8V 100 **60_OHM** — 37 Ohm @ 3.3V, 60 Ohm @ 1.8V 101 **50_OHM** — 30 Ohm @ 3.3V, 50 Ohm @ 1.8V 110 **40_OHM** — 25 Ohm @ 3.3V, 40 Ohm @ 1.8V 111 **33_OHM** — 20 Ohm @ 3.3V, 33 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 0 **SLOW** — Slow Slew Rate 1 **FAST** — Fast Slew Rate

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDBA0 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDBA0. 0 **CMOS** — CMOS input mode. 1 **DIFFERENTIAL** — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDBA0.

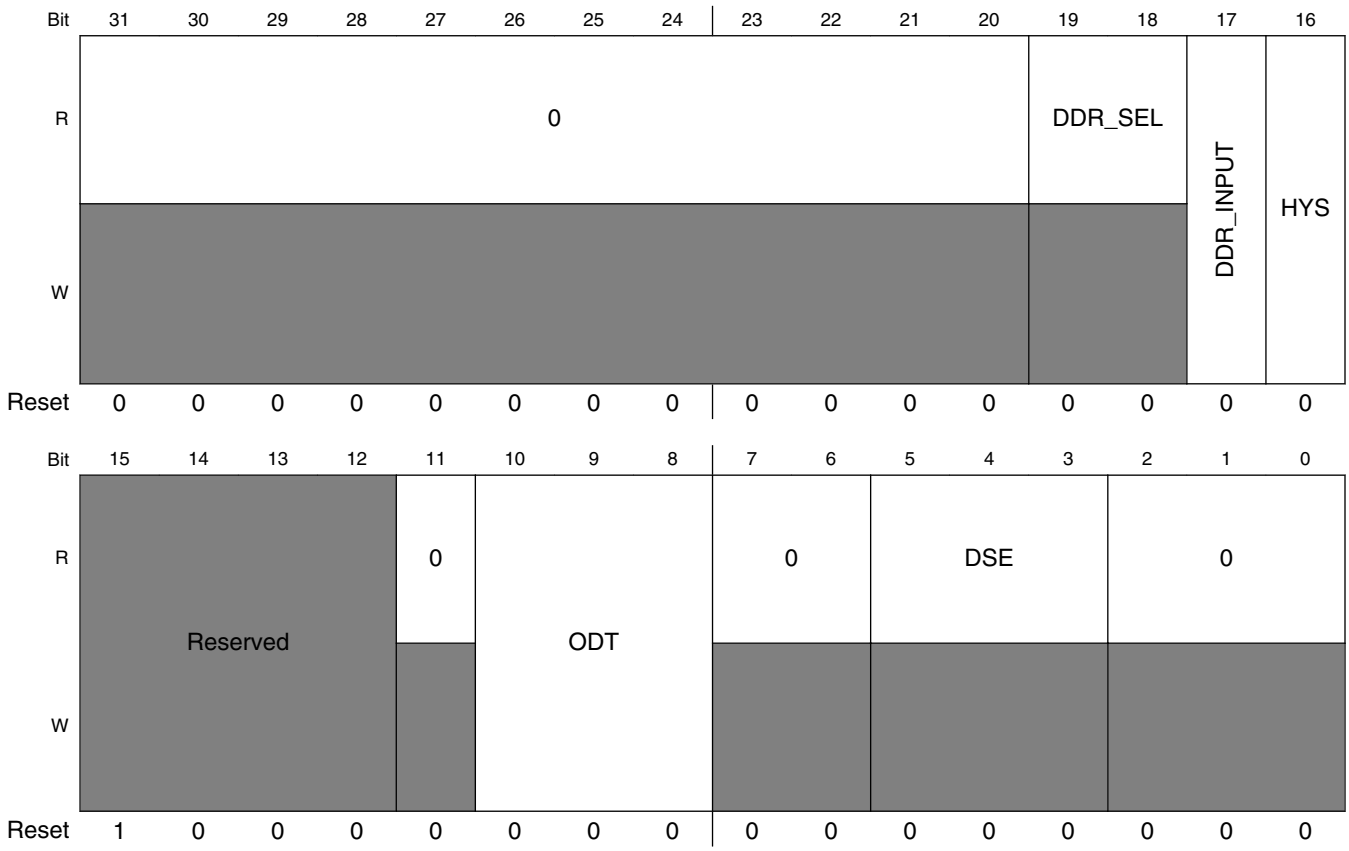
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDBA0 field descriptions (continued)

Field	Description
	0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDBA0. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_ADDDS Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

36.4.349 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_SDBA1)

Address: 20E_0000h base + 584h offset = 20E_0584h



IOMUXC_SW_PAD_CTL_PAD_DRAM_SDBA1 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDBA1. 0 **CMOS** — CMOS input mode. 1 **DIFFERENTIAL** — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDBA1.

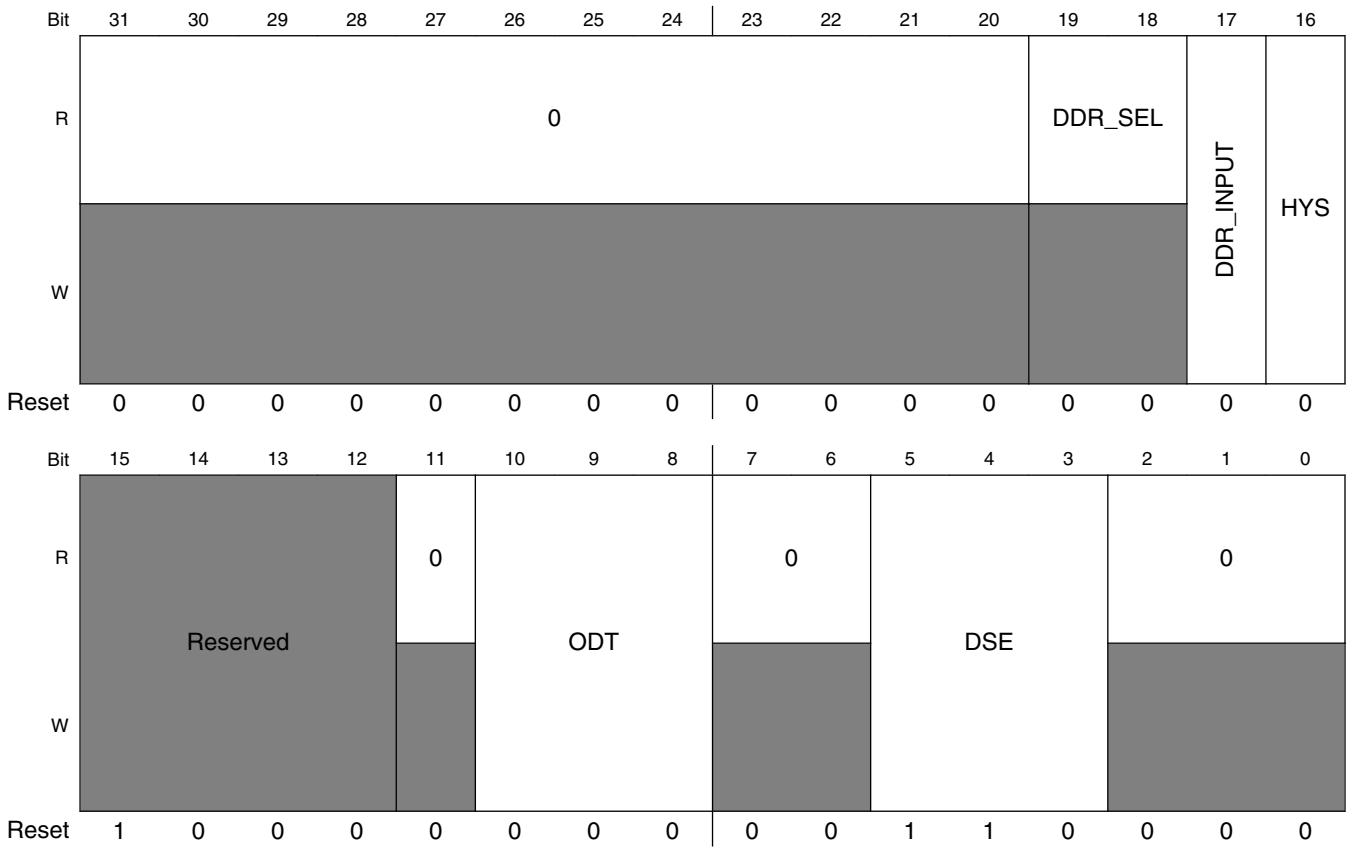
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDBA1 field descriptions (continued)

Field	Description
	0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDBA1. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_ADDDS Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

36.4.350 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCLK0_P)

Address: 20E_0000h base + 588h offset = 20E_0588h



IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCLK0_P field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDCLK_0. 0 **CMOS** — CMOS input mode. 1 **DIFFERENTIAL** — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDCLK_0.

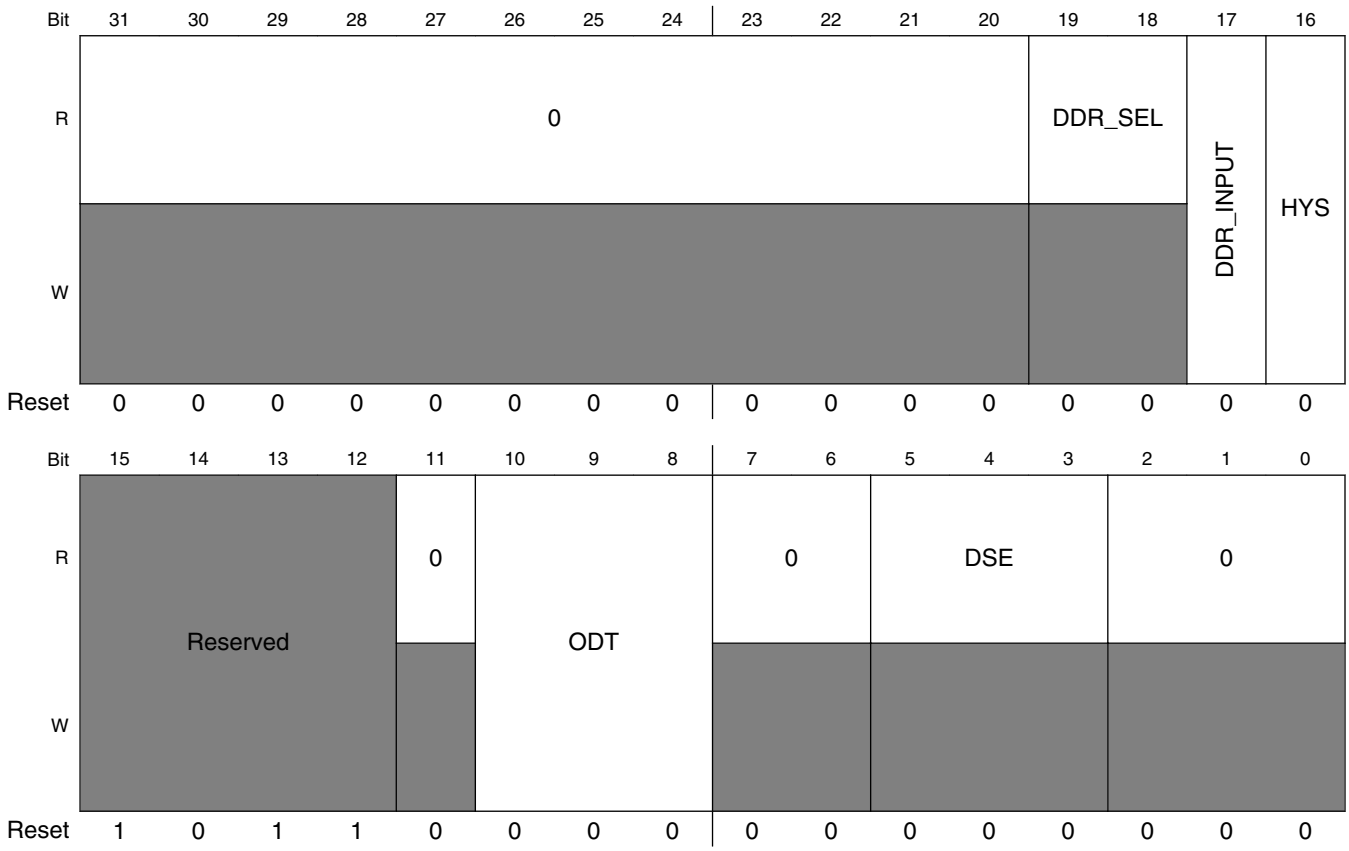
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCLK0_P field descriptions (continued)

Field	Description
	0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDCLK_0. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field Select one of next values for pad: DRAM_SDCLK_0. 000 **HIZ** — HI-Z 001 **240_OHM** — 240 Ohm 010 **120_OHM** — 120 Ohm 011 **80_OHM** — 80 Ohm 100 **60_OHM** — 60 Ohm 101 **48_OHM** — 48 Ohm 110 **40_OHM** — 40 Ohm 111 **34_OHM** — 34 Ohm
Reserved	This read-only field is reserved and always has the value 0.

36.4.351 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_SDBA2)

Address: 20E_0000h base + 58Ch offset = 20E_058Ch



IOMUXC_SW_PAD_CTL_PAD_DRAM_SDBA2 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDBA2. 0 **CMOS** — CMOS input mode. 1 **DIFFERENTIAL** — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDBA2.

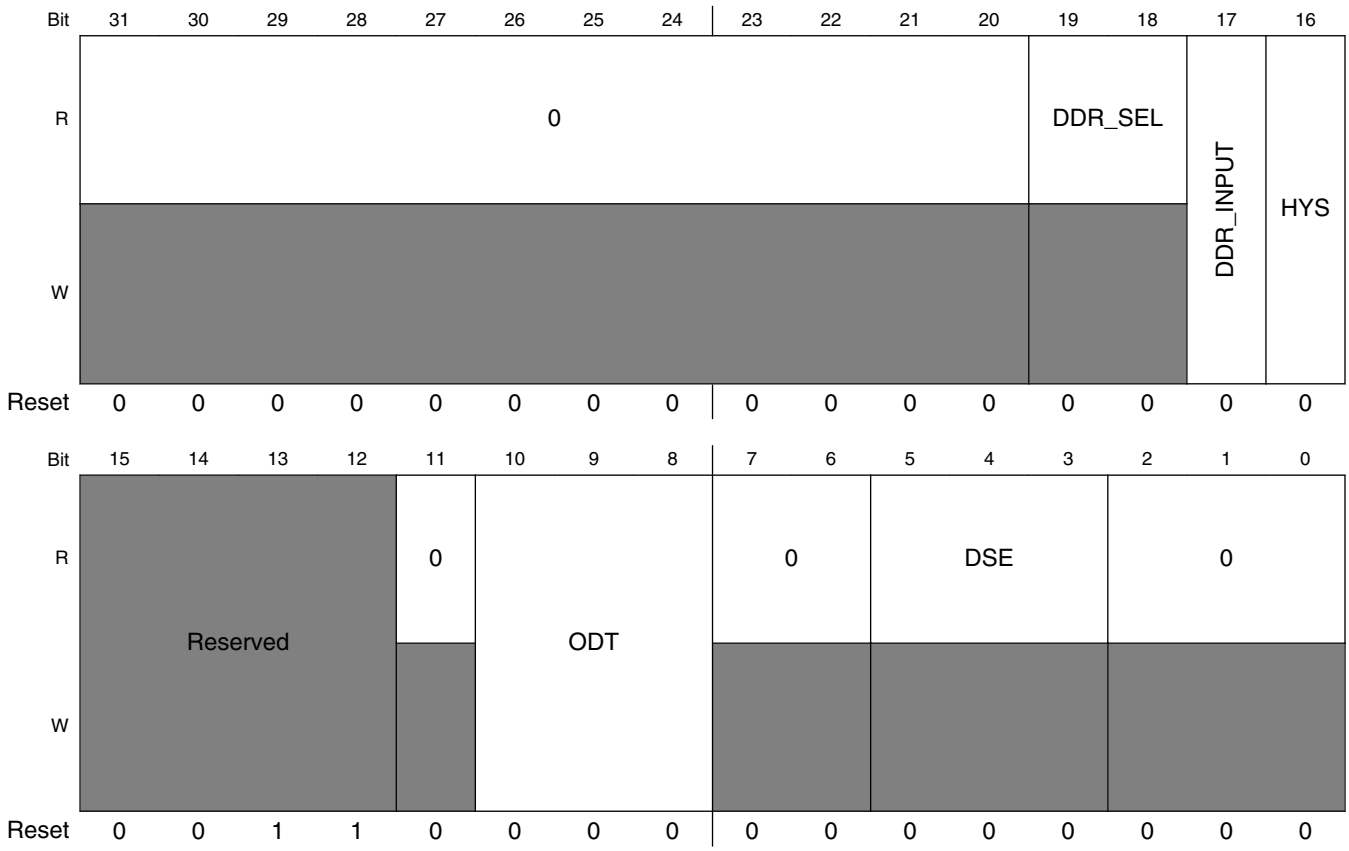
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDBA2 field descriptions (continued)

Field	Description
	0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDBA2. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_CTLDS Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

36.4.352 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCKE0)

Address: 20E_0000h base + 590h offset = 20E_0590h



IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCKE0 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDCKE0. 0 **CMOS** — CMOS input mode. 1 **DIFFERENTIAL** — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDCKE0.

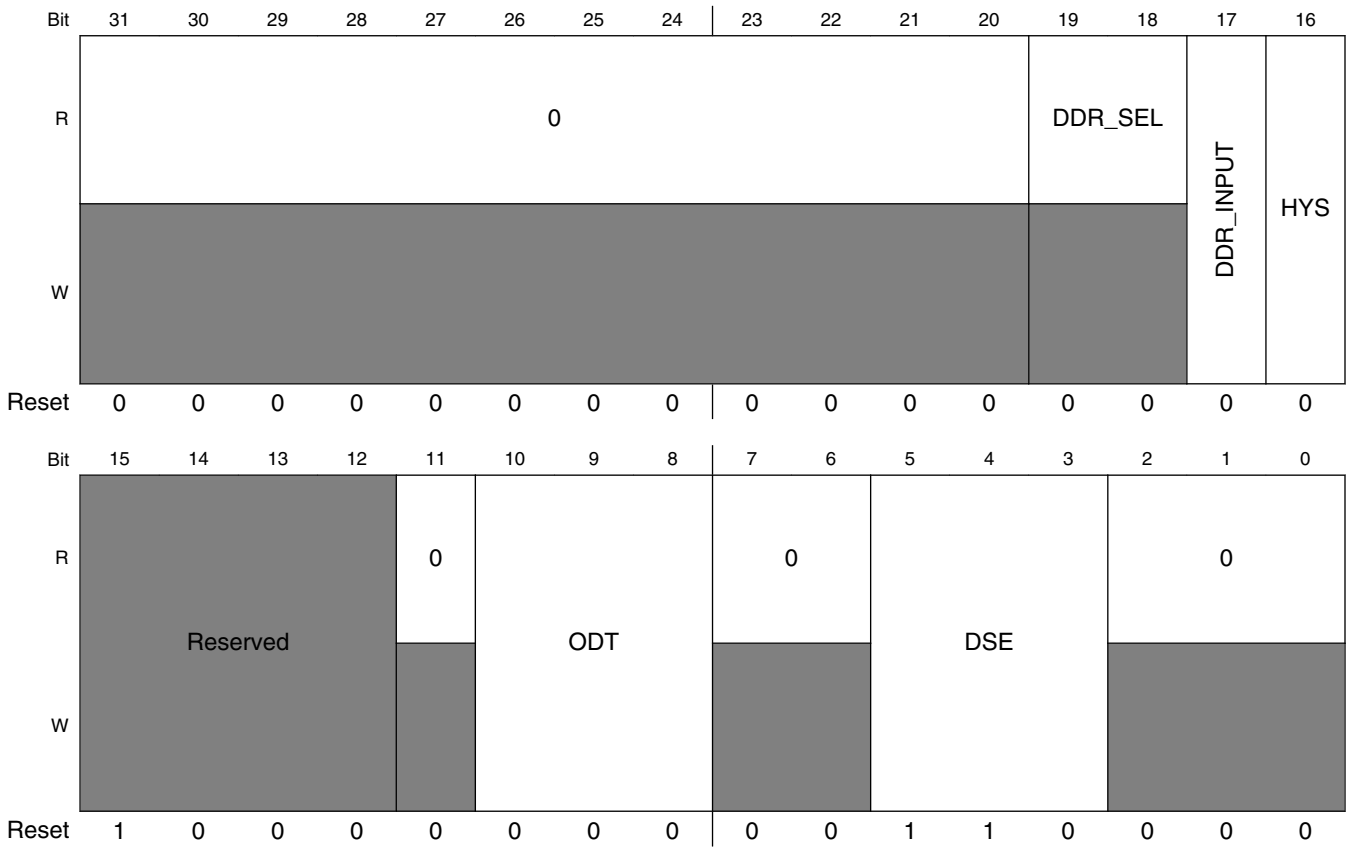
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCKE0 field descriptions (continued)

Field	Description
	0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDCKE0. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_CTLDS Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

36.4.353 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCLK1_P)

Address: 20E_0000h base + 594h offset = 20E_0594h



IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCLK1_P field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDCLK_1. 0 **CMOS** — CMOS input mode. 1 **DIFFERENTIAL** — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDCLK_1.

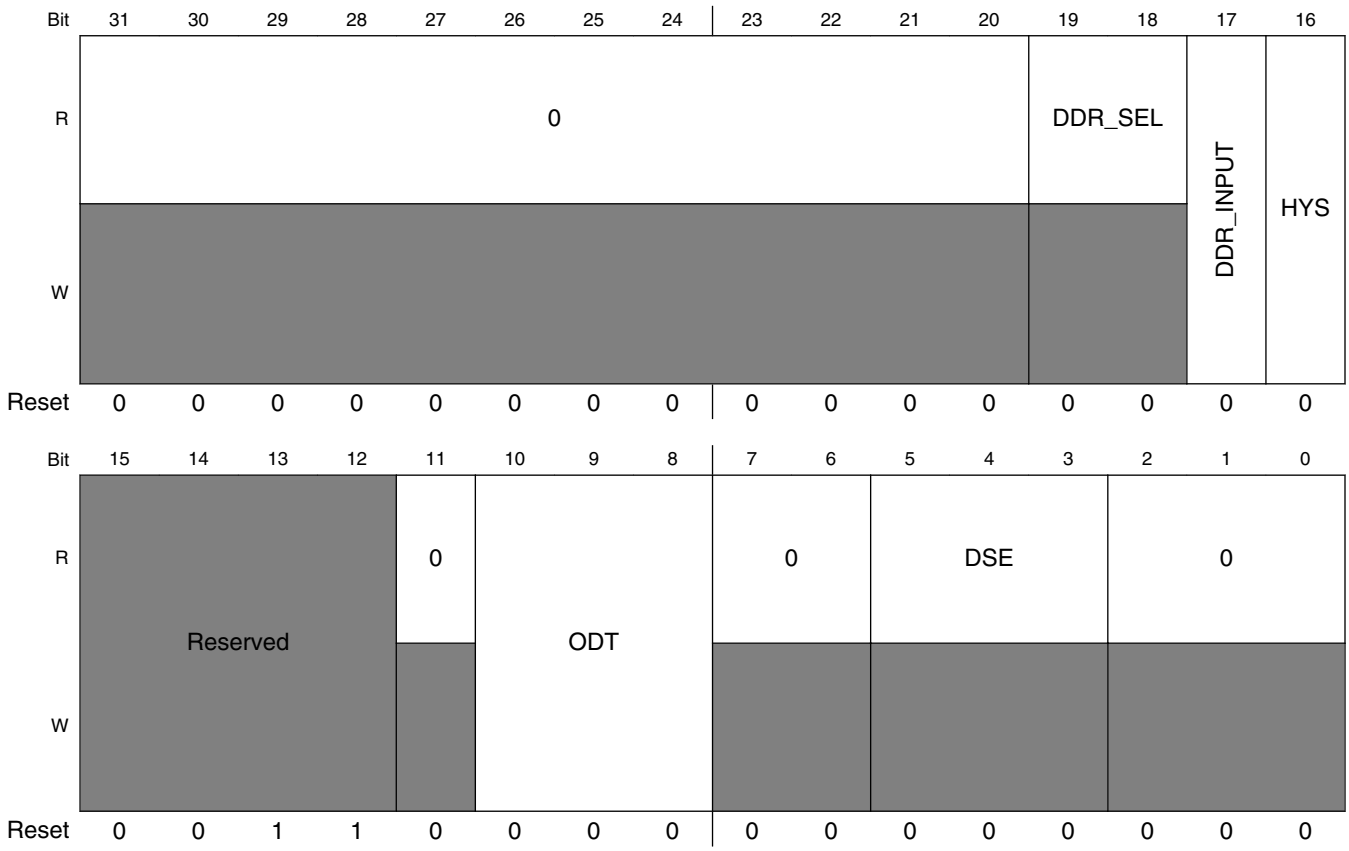
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCLK1_P field descriptions (continued)

Field	Description
	0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDCLK_1. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field Select one of next values for pad: DRAM_SDCLK_1. 000 **HIZ** — HI-Z 001 **240_OHM** — 240 Ohm 010 **120_OHM** — 120 Ohm 011 **80_OHM** — 80 Ohm 100 **60_OHM** — 60 Ohm 101 **48_OHM** — 48 Ohm 110 **40_OHM** — 40 Ohm 111 **34_OHM** — 34 Ohm
Reserved	This read-only field is reserved and always has the value 0.

36.4.354 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCKE1)

Address: 20E_0000h base + 598h offset = 20E_0598h



IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCKE1 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDCKE1. 0 **CMOS** — CMOS input mode. 1 **DIFFERENTIAL** — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDCKE1.

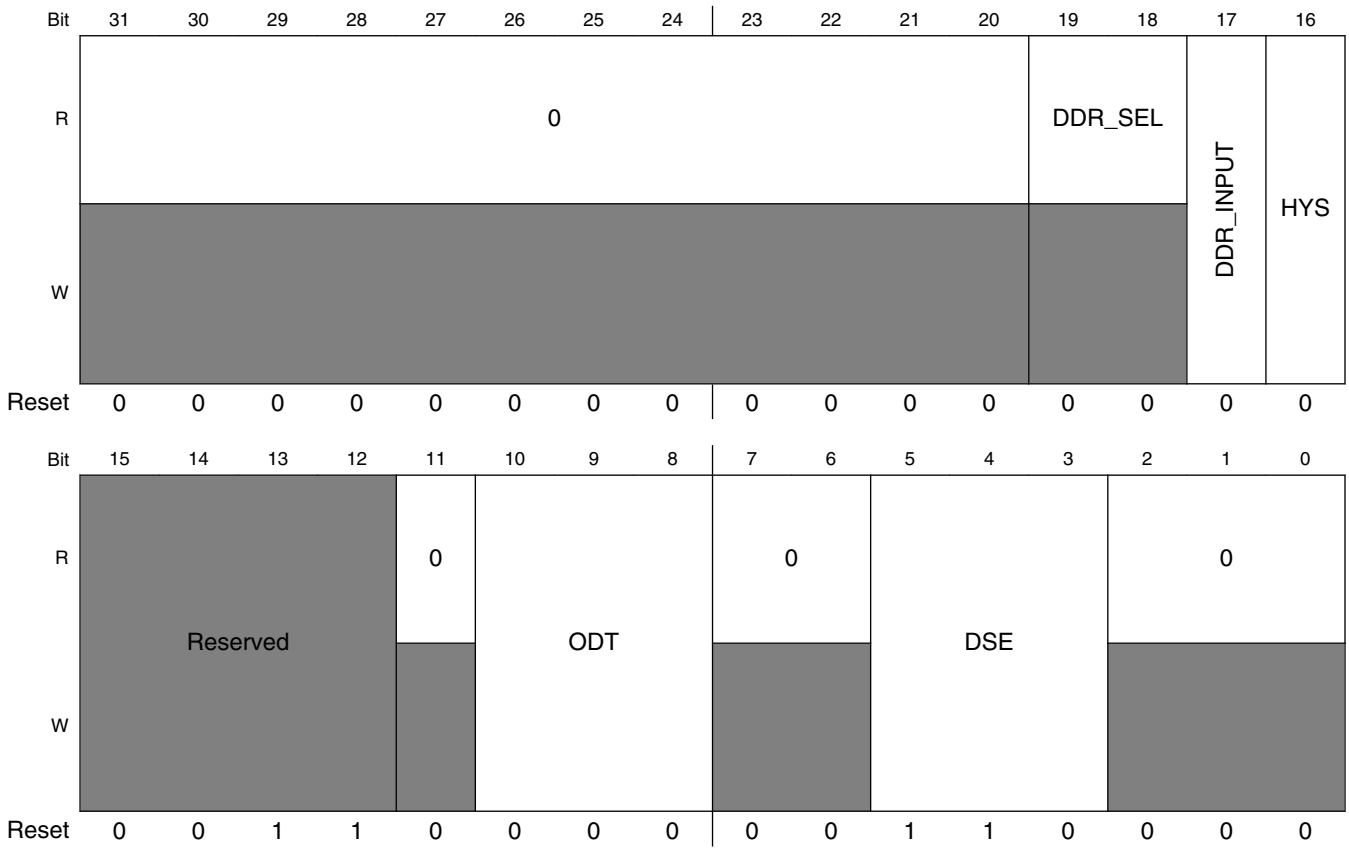
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDCKE1 field descriptions (continued)

Field	Description
	0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDCKE1. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_CTLDS Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

36.4.355 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_ODT0)

Address: 20E_0000h base + 59Ch offset = 20E_059Ch



IOMUXC_SW_PAD_CTL_PAD_DRAM_ODT0 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDODT0. 0 **CMOS** — CMOS input mode. 1 **DIFFERENTIAL** — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDODT0.

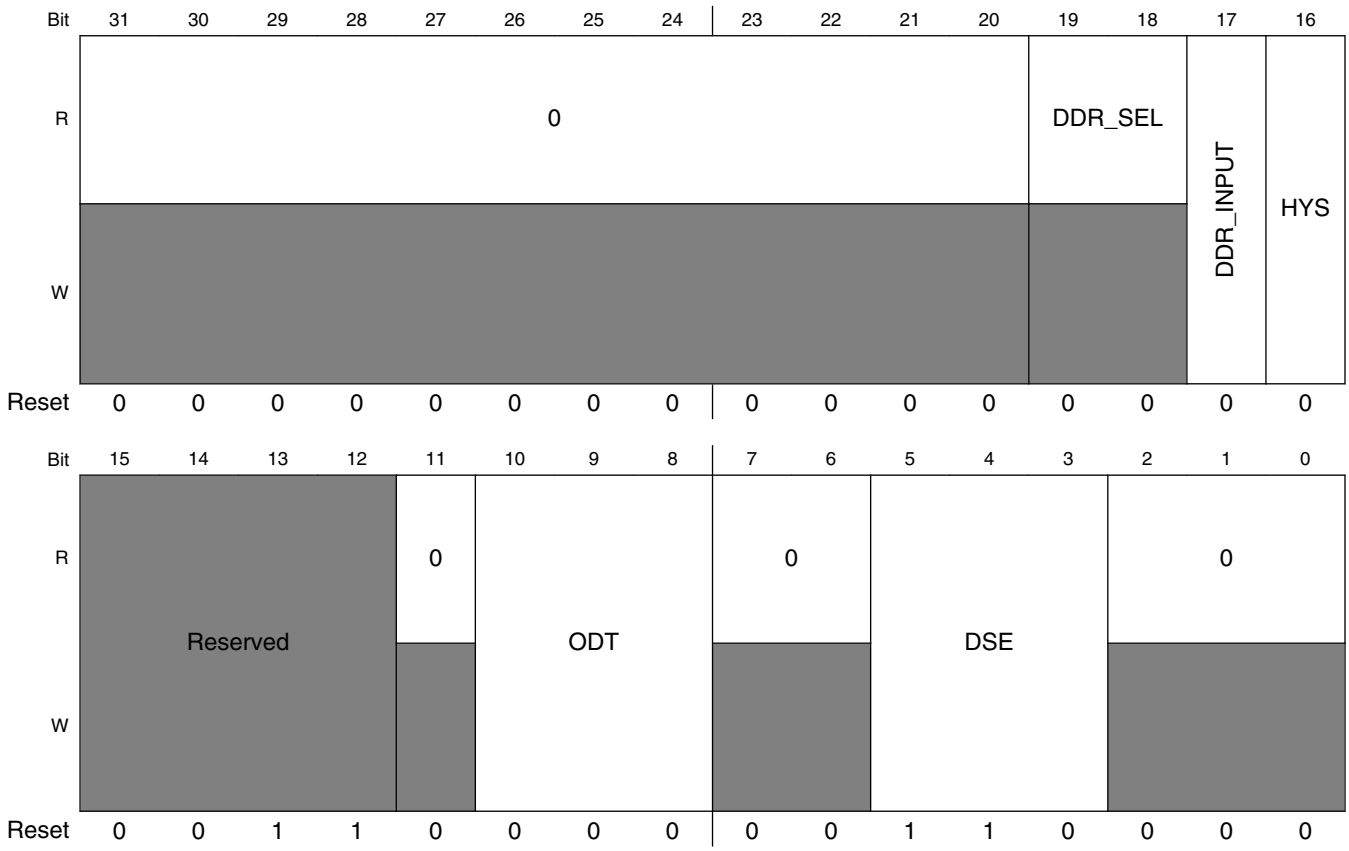
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_ODT0 field descriptions (continued)

Field	Description
	0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDODT0. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field Select one of next values for pad: DRAM_SDODT0. 000 **HIZ** — HI-Z 001 **240_OHM** — 240 Ohm 010 **120_OHM** — 120 Ohm 011 **80_OHM** — 80 Ohm 100 **60_OHM** — 60 Ohm 101 **48_OHM** — 48 Ohm 110 **40_OHM** — 40 Ohm 111 **34_OHM** — 34 Ohm
Reserved	This read-only field is reserved and always has the value 0.

36.4.356 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_ODT1)

Address: 20E_0000h base + 5A0h offset = 20E_05A0h



IOMUXC_SW_PAD_CTL_PAD_DRAM_ODT1 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDODT1. 0 **CMOS** — CMOS input mode. 1 **DIFFERENTIAL** — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDODT1.

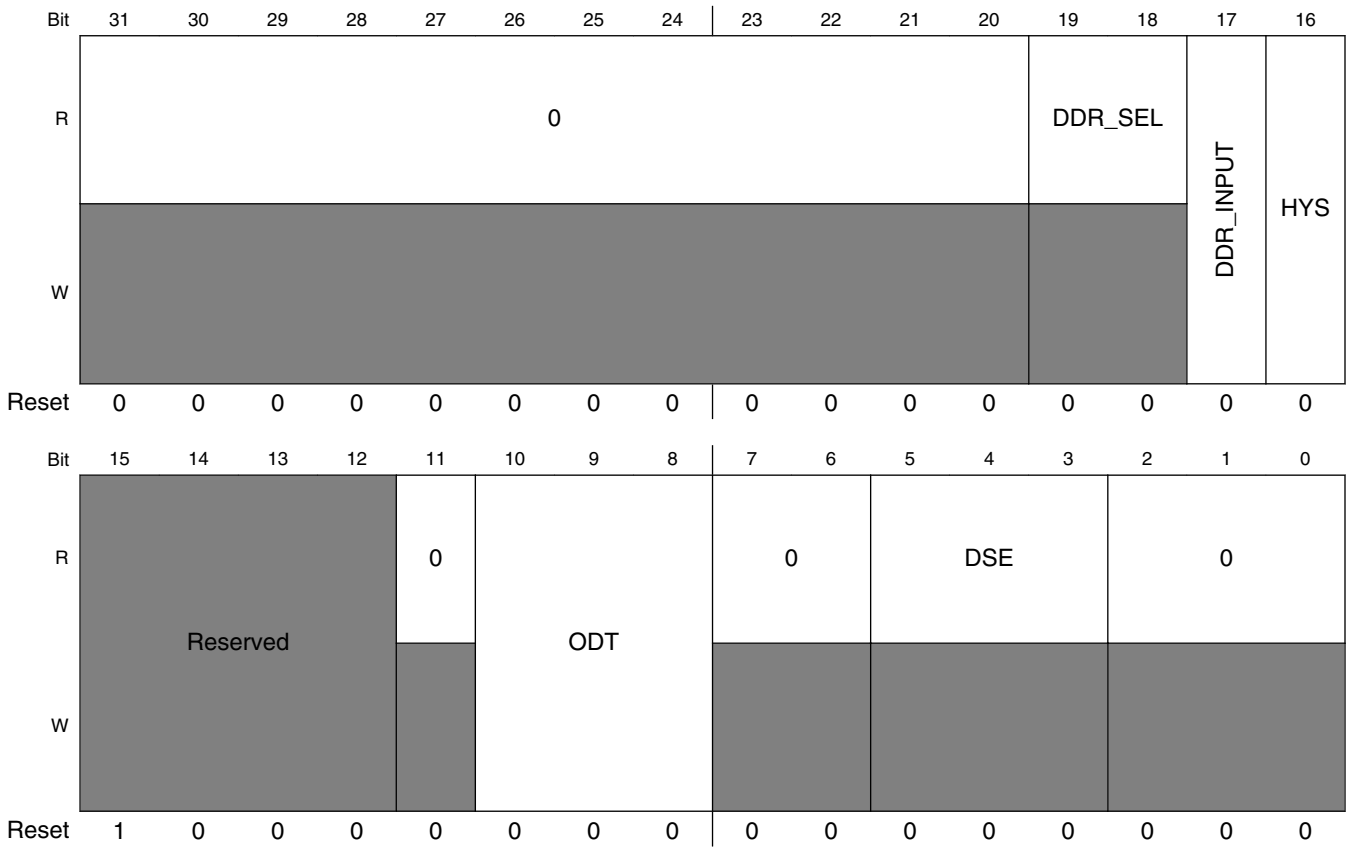
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_ODT1 field descriptions (continued)

Field	Description
	0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDODT1. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field Select one of next values for pad: DRAM_SDODT1. 000 **HIZ** — HI-Z 001 **240_OHM** — 240 Ohm 010 **120_OHM** — 120 Ohm 011 **80_OHM** — 80 Ohm 100 **60_OHM** — 60 Ohm 101 **48_OHM** — 48 Ohm 110 **40_OHM** — 40 Ohm 111 **34_OHM** — 34 Ohm
Reserved	This read-only field is reserved and always has the value 0.

36.4.357 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_SDWE_B)

Address: 20E_0000h base + 5A4h offset = 20E_05A4h



IOMUXC_SW_PAD_CTL_PAD_DRAM_SDWE_B field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDWE. 0 **CMOS** — CMOS input mode. 1 **DIFFERENTIAL** — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDWE.

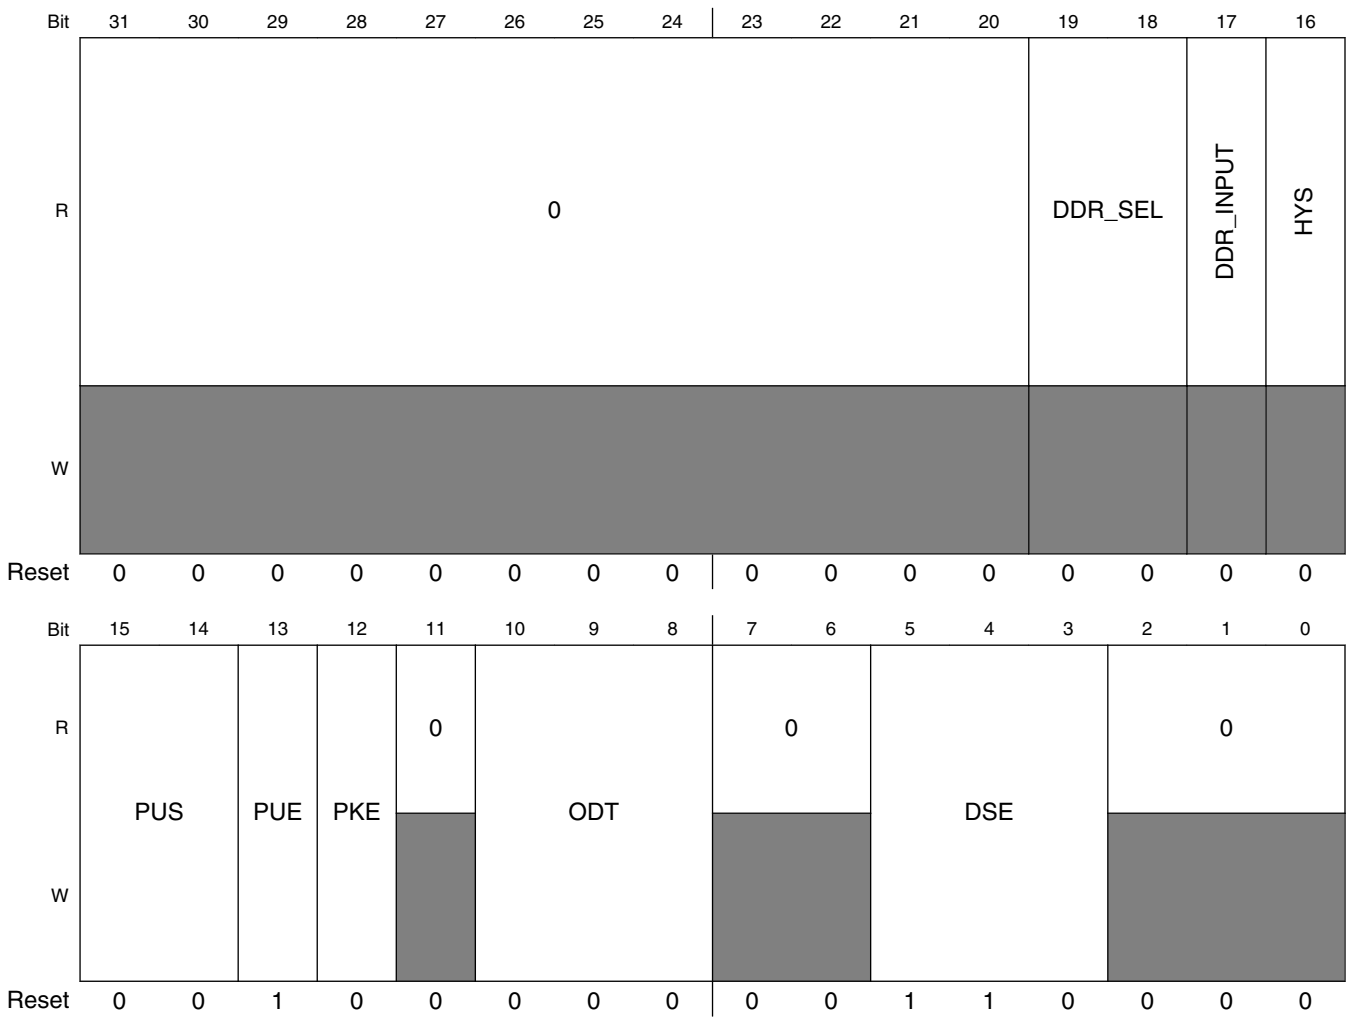
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDWE_B field descriptions (continued)

Field	Description
	0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDWE. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_CTLDS Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

36.4.358 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_SDQS0_P)

Address: 20E_0000h base + 5A8h offset = 20E_05A8h



IOMUXC_SW_PAD_CTL_PAD_DRAM_SDQS0_P field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDRMODE_CTL

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDQS0_P field descriptions (continued)

Field	Description
	Note: The value of this field does not reflect the value of the Group Control Register.
16 HYS	Hysteresis Enable Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDRHYS Note: The value of this field does not reflect the value of the Group Control Register.
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: DRAM_SDQS0. 00 **100K_OHM_PD** — 100K Ohm Pull Down 01 **47K_OHM_PU** — 47K Ohm Pull Up 10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: DRAM_SDQS0. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: DRAM_SDQS0. 0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDQS0. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field Select one of next values for pad: DRAM_SDQS0. 000 **HIZ** — HI-Z 001 **240_OHM** — 240 Ohm 010 **120_OHM** — 120 Ohm 011 **80_OHM** — 80 Ohm 100 **60_OHM** — 60 Ohm

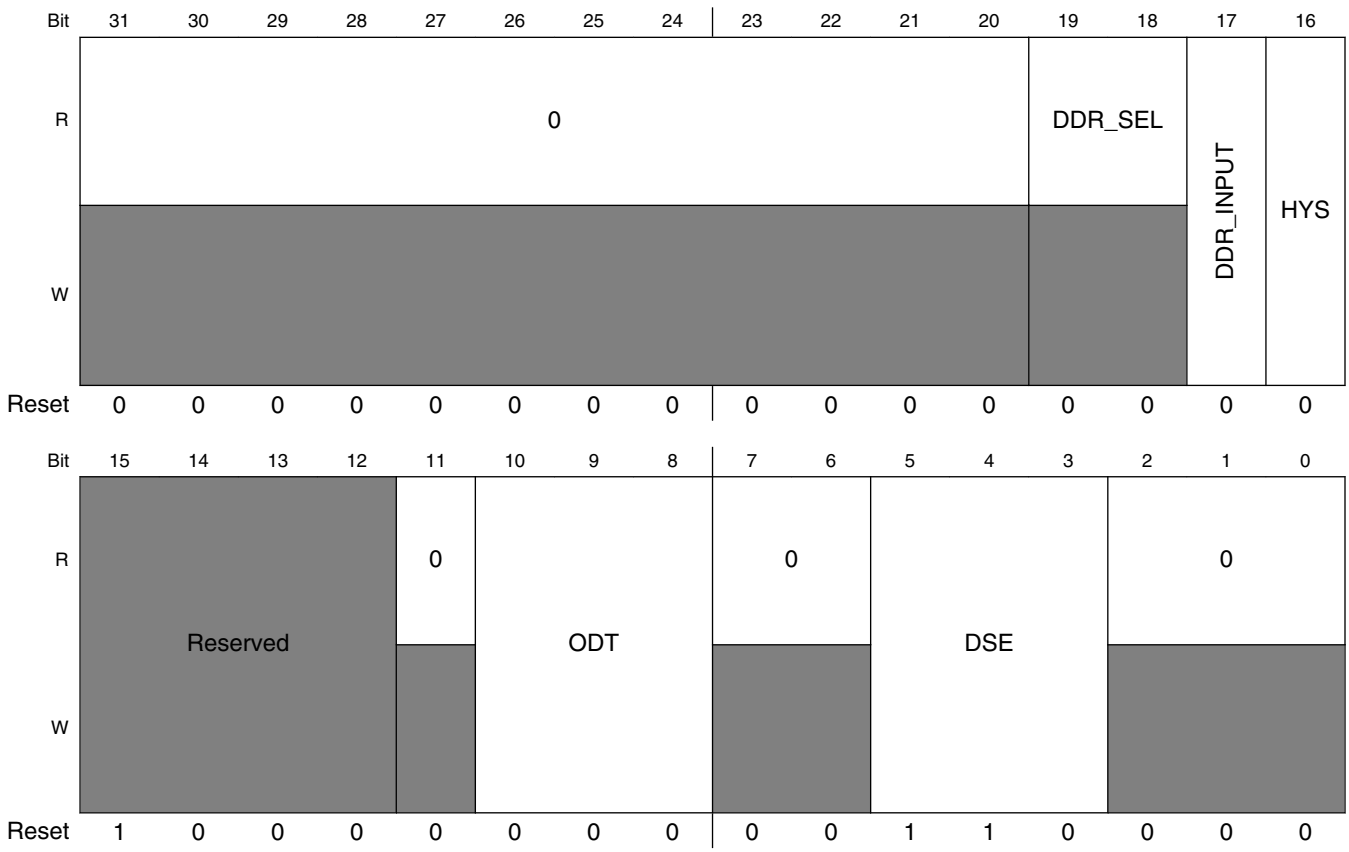
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDQS0_P field descriptions (continued)

Field	Description
	101 **48_OHM** — 48 Ohm 110 **40_OHM** — 40 Ohm 111 **34_OHM** — 34 Ohm
Reserved	This read-only field is reserved and always has the value 0.

36.4.359 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_DQM0)

Address: 20E_0000h base + 5ACh offset = 20E_05ACh



IOMUXC_SW_PAD_CTL_PAD_DRAM_DQM0 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE

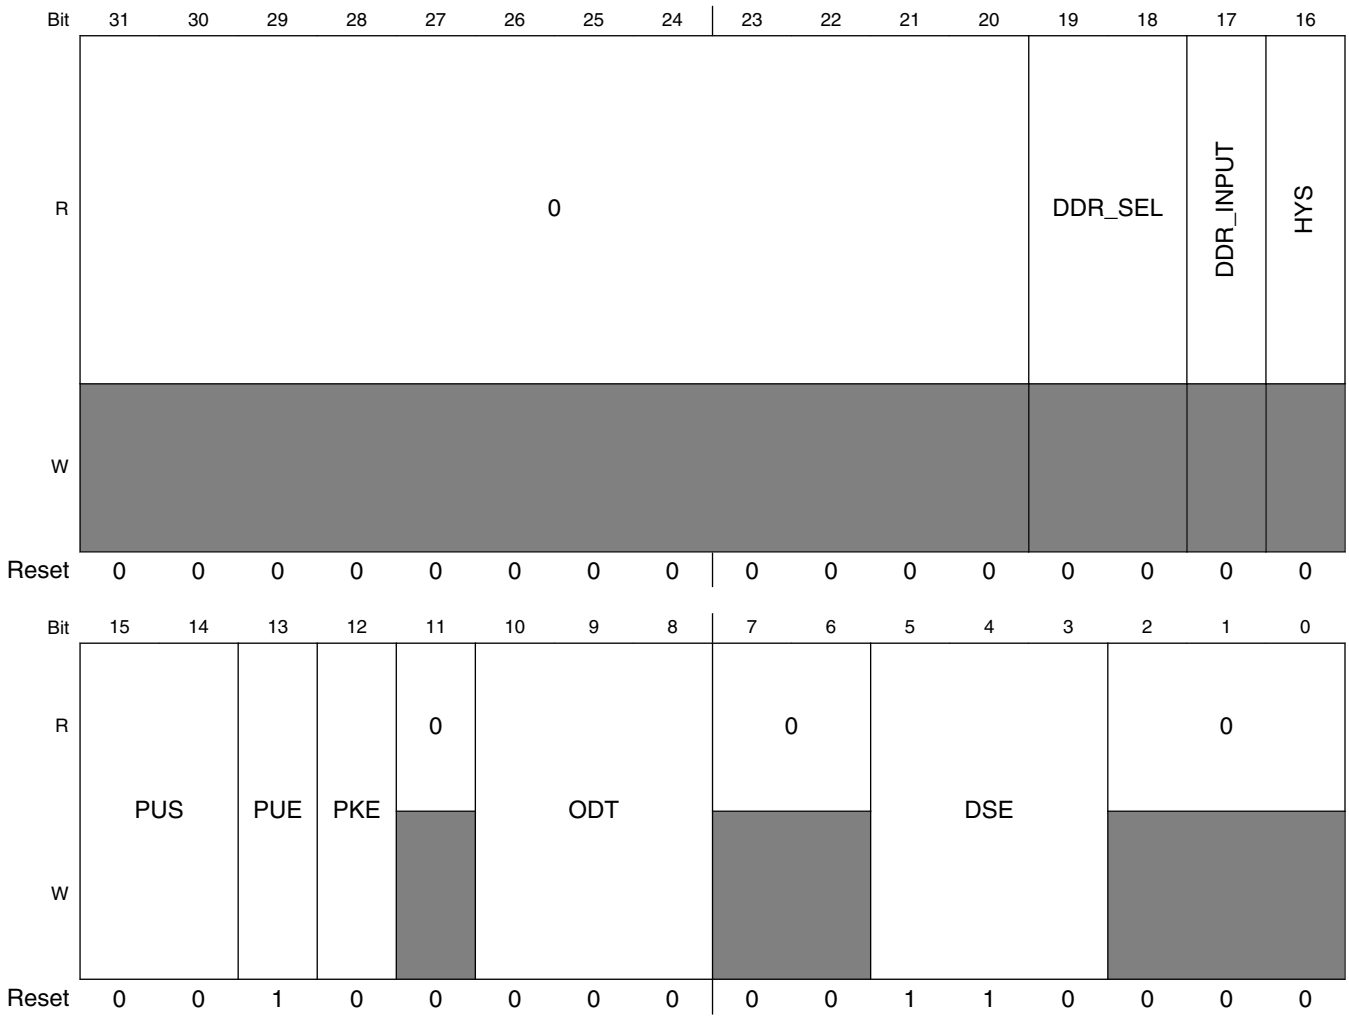
Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_DQM0 field descriptions (continued)

Field	Description
	Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_DQM0. 0 **CMOS** — CMOS input mode. 1 **DIFFERENTIAL** — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_DQM0. 0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_DQM0. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field Select one of next values for pad: DRAM_DQM0. 000 **HIZ** — HI-Z 001 **240_OHM** — 240 Ohm 010 **120_OHM** — 120 Ohm 011 **80_OHM** — 80 Ohm 100 **60_OHM** — 60 Ohm 101 **48_OHM** — 48 Ohm 110 **40_OHM** — 40 Ohm 111 **34_OHM** — 34 Ohm
Reserved	This read-only field is reserved and always has the value 0.

36.4.360 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_DRAM_SDQS1_P)

Address: 20E_0000h base + 5B0h offset = 20E_05B0h



IOMUXC_SW_PAD_CTL_PAD_DRAM_SDQS1_P field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDRMODE_CTL

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_DRAM_SDQS1_P field descriptions (continued)

Field	Description
	Note: The value of this field does not reflect the value of the Group Control Register.
16 HYS	Hysteresis Enable Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDRHYS Note: The value of this field does not reflect the value of the Group Control Register.
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: DRAM_SDQS1. 00 **100K_OHM_PD** — 100K Ohm Pull Down 01 **47K_OHM_PU** — 47K Ohm Pull Up 10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: DRAM_SDQS1. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: DRAM_SDQS1. 0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDQS1. 000 **DISABLED** — Disabled 001 **120_OHM** — 120 Ohm ODT 010 **60_OHM** — 60 Ohm ODT 011 **40_OHM** — 40 Ohm ODT 100 **30_OHM** — 30 Ohm ODT 101 **24_OHM** — 24 Ohm ODT 110 **20_OHM** — 20 Ohm ODT 111 **17_OHM** — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field Select one of next values for pad: DRAM_SDQS1. 000 **HIZ** — HI-Z 001 **240_OHM** — 240 Ohm 010 **120_OHM** — 120 Ohm 011 **80_OHM** — 80 Ohm 100 **60_OHM** — 60 Ohm

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_CSI0_DATA06 field descriptions (continued)

Field	Description
	0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: CSI0_DAT6. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 **90_OHM** — 50 Ohm @ 3.3V, 90 Ohm @ 1.8V 100 **60_OHM** — 37 Ohm @ 3.3V, 60 Ohm @ 1.8V 101 **50_OHM** — 30 Ohm @ 3.3V, 50 Ohm @ 1.8V 110 **40_OHM** — 25 Ohm @ 3.3V, 40 Ohm @ 1.8V 111 **33_OHM** — 20 Ohm @ 3.3V, 33 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 0 **SLOW** — Slow Slew Rate 1 **FAST** — Fast Slew Rate

36.4.397 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_CSI0_DATA07)

Address: 20E_0000h base + 644h offset = 20E_0644h

IOMUXC_SW_PAD_CTL_PAD_CSI0_DATA13 field descriptions (continued)

Field	Description
	10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: CSI0_DAT13. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: CSI0_DAT13. 0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: CSI0_DAT13. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 **90_OHM** — 50 Ohm @ 3.3V, 90 Ohm @ 1.8V 100 **60_OHM** — 37 Ohm @ 3.3V, 60 Ohm @ 1.8V 101 **50_OHM** — 30 Ohm @ 3.3V, 50 Ohm @ 1.8V 110 **40_OHM** — 25 Ohm @ 3.3V, 40 Ohm @ 1.8V 111 **33_OHM** — 20 Ohm @ 3.3V, 33 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details.

IOMUXC_SW_PAD_CTL_PAD_SD3_DATA4 field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: SD3_DAT4. 0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: SD3_DAT4. 00 **100K_OHM_PD** — 100K Ohm Pull Down 01 **47K_OHM_PU** — 47K Ohm Pull Up 10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: SD3_DAT4. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: SD3_DAT4. 0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: SD3_DAT4. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_SD3_RESET field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: SD3_RST. 0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: SD3_RST. 00 **100K_OHM_PD** — 100K Ohm Pull Down 01 **47K_OHM_PU** — 47K Ohm Pull Up 10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: SD3_RST. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: SD3_RST. 0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_SD3_RESET field descriptions (continued)

Field	Description
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: SD3_RST. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 **90_OHM** — 50 Ohm @ 3.3V, 90 Ohm @ 1.8V 100 **60_OHM** — 37 Ohm @ 3.3V, 60 Ohm @ 1.8V 101 **50_OHM** — 30 Ohm @ 3.3V, 50 Ohm @ 1.8V 110 **40_OHM** — 25 Ohm @ 3.3V, 40 Ohm @ 1.8V 111 **33_OHM** — 20 Ohm @ 3.3V, 33 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 0 **SLOW** — Slow Slew Rate 1 **FAST** — Fast Slew Rate

IOMUXC_SW_PAD_CTL_PAD_NAND_CS2_B field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: NANDF_CS2. 0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: NANDF_CS2. 00 **100K_OHM_PD** — 100K Ohm Pull Down 01 **47K_OHM_PU** — 47K Ohm Pull Up 10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: NANDF_CS2. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: NANDF_CS2.

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_NAND_CS2_B field descriptions (continued)

Field	Description
	0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: NANDF_CS2. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 **90_OHM** — 50 Ohm @ 3.3V, 90 Ohm @ 1.8V 100 **60_OHM** — 37 Ohm @ 3.3V, 60 Ohm @ 1.8V 101 **50_OHM** — 30 Ohm @ 3.3V, 50 Ohm @ 1.8V 110 **40_OHM** — 25 Ohm @ 3.3V, 40 Ohm @ 1.8V 111 **33_OHM** — 20 Ohm @ 3.3V, 33 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 0 **SLOW** — Slow Slew Rate 1 **FAST** — Fast Slew Rate

36.4.434 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_NAND_CS3_B)

Address: 20E_0000h base + 6D8h offset = 20E_06D8h

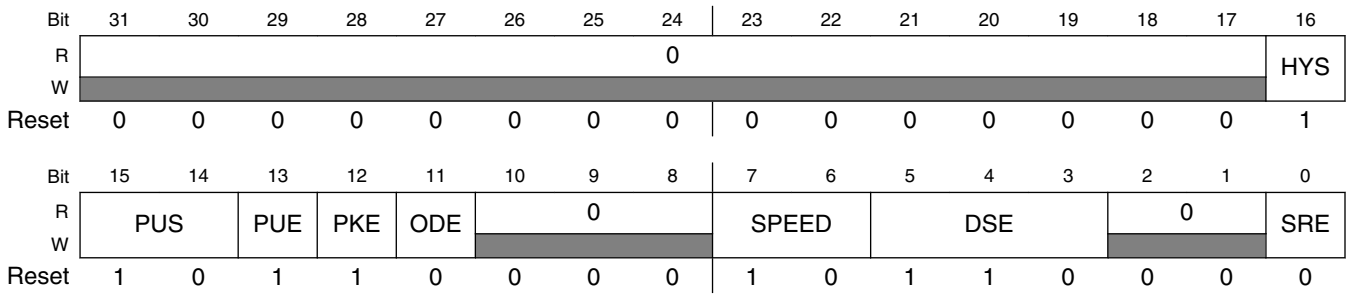
IOMUXC_SW_PAD_CTL_PAD_SD1_DATA1 field descriptions (continued)

Field	Description
	0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 00 **LOW** — Low frequency (50 MHz) 01 **MEDIUM** — Medium frequency (100, 150 MHz) 10 **MEDIUM** — Medium frequency (100, 150 MHz) 11 **MAXIMUM** — Maximum frequency (100, 150, 200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: SD1_DAT1. 000 **HIZ** — HI-Z 001 **260_OHM** — 150 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 **130_OHM** — 75 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 **90_OHM** — 50 Ohm @ 3.3V, 90 Ohm @ 1.8V 100 **60_OHM** — 37 Ohm @ 3.3V, 60 Ohm @ 1.8V 101 **50_OHM** — 30 Ohm @ 3.3V, 50 Ohm @ 1.8V 110 **40_OHM** — 25 Ohm @ 3.3V, 40 Ohm @ 1.8V 111 **33_OHM** — 20 Ohm @ 3.3V, 33 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency for more details. 0 **SLOW** — Slow Slew Rate 1 **FAST** — Fast Slew Rate

36.4.454 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_SD1_DATA0)

Address: 20E_0000h base + 728h offset = 20E_0728h



IOMUXC_SW_PAD_CTL_PAD_SD1_DATA0 field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: SD1_DAT0. 0 **DISABLED** — CMOS input 1 **ENABLED** — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: SD1_DAT0. 00 **100K_OHM_PD** — 100K Ohm Pull Down 01 **47K_OHM_PU** — 47K Ohm Pull Up 10 **100K_OHM_PU** — 100K Ohm Pull Up 11 **22K_OHM_PU** — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: SD1_DAT0. 0 **KEEP** — Keeper Enabled 1 **PULL** — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: SD1_DAT0. 0 **DISABLED** — Pull/Keeper Disabled 1 **ENABLED** — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 **DISABLED** — Output is CMOS. 1 **ENABLED** — Output is Open Drain.

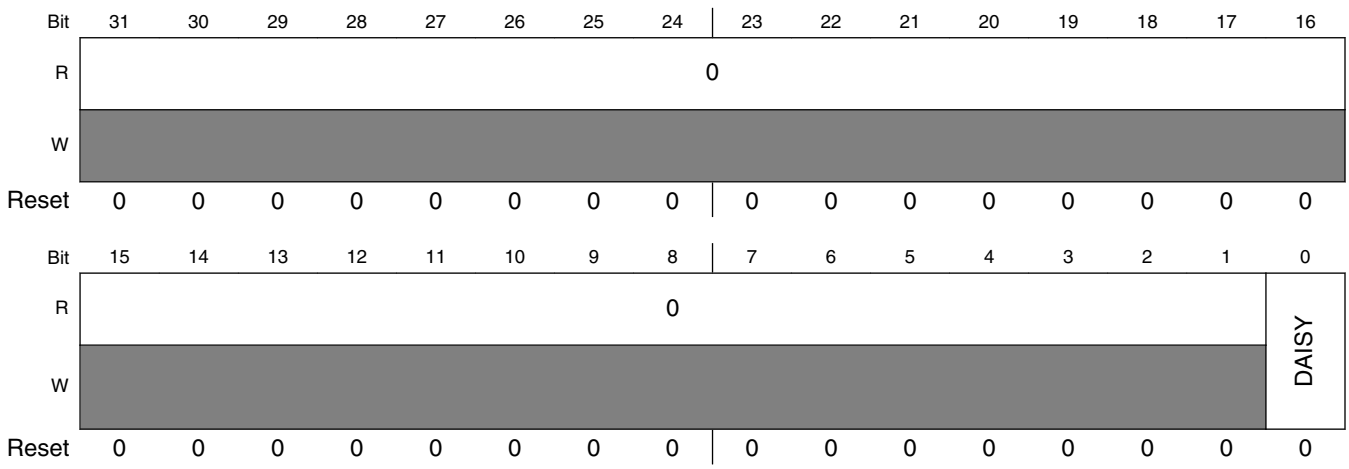
IOMUXC_ECSPI5_SS1_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **SD2_DATA2_ALT1** — Selecting ALT1 mode of pad SD2_DAT2 for ECSPI5_SS1. 1 **SD1_DATA2_ALT1** — Selecting ALT1 mode of pad SD1_DAT2 for ECSPI5_SS1.

36.4.522 Select Input Register (IOMUXC_ENET_REF_CLK_SELECT_INPUT)

Address: 20E_0000h base + 83Ch offset = 20E_083Ch

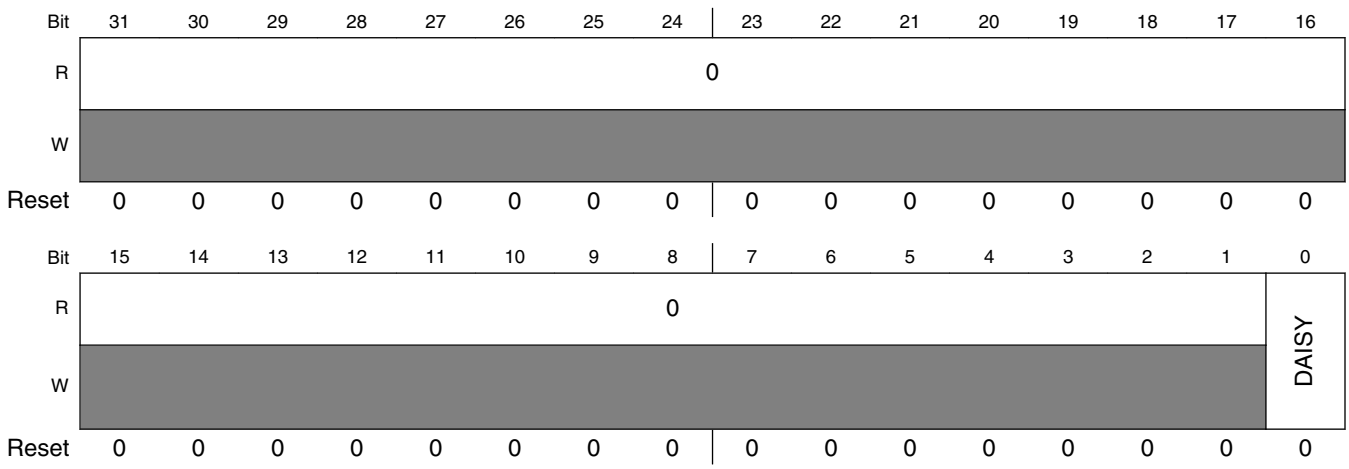


IOMUXC_ENET_REF_CLK_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **RGMII_TX_CTL_ALT7** — Selecting ALT7 mode of pad RGMII_TX_CTL for ENET_REF_CLK. 1 **GPIO16_ALT2** — Selecting ALT2 mode of pad GPIO_16 for ENET_REF_CLK.

36.4.523 Select Input Register (IOMUXC_ENET_MAC0_MDIO_SELECT_INPUT)

Address: 20E_0000h base + 840h offset = 20E_0840h

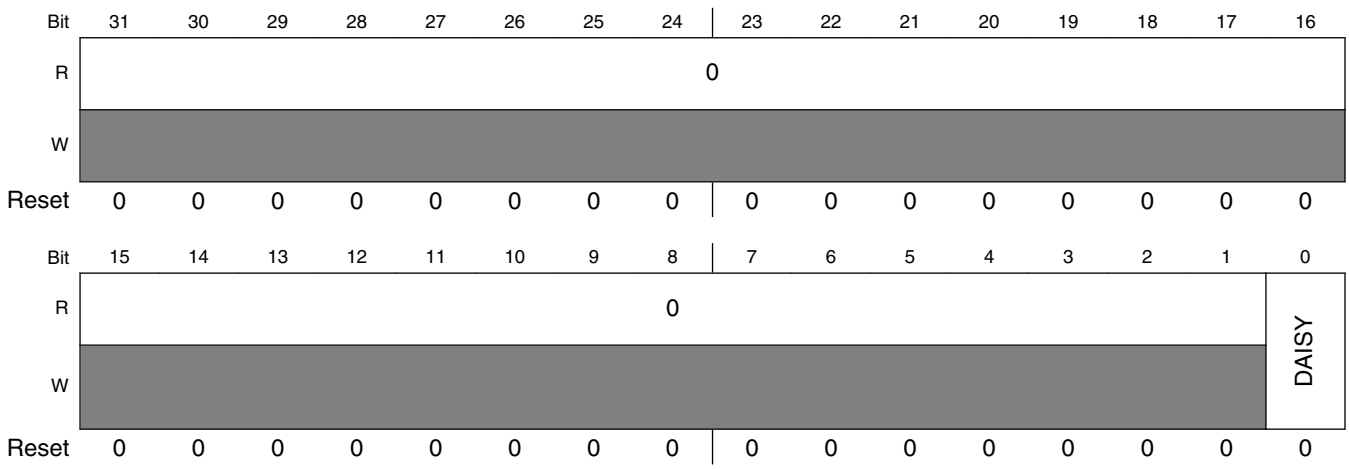


IOMUXC_ENET_MAC0_MDIO_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **ENET_MDIO_ALT1** — Selecting ALT1 mode of pad ENET_MDIO for ENET_MDIO. 1 **KEY_COL1_ALT1** — Selecting ALT1 mode of pad KEY_COL1 for ENET_MDIO.

36.4.524 Select Input Register (IOMUXC_ENET_MAC0_RX_CLK_SELECT_INPUT)

Address: 20E_0000h base + 844h offset = 20E_0844h

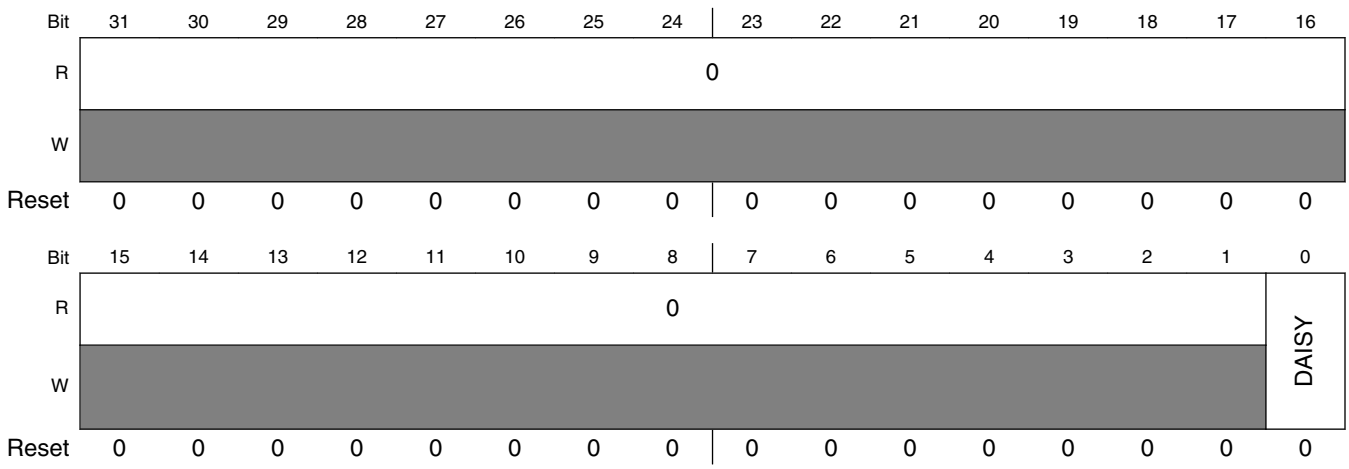


IOMUXC_ENET_MAC0_RX_CLK_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **RGMII_RXC_ALT1** — Selecting ALT1 mode of pad RGMII_RXC for RGMII_RXC. 1 **GPIO18_ALT1** — Selecting ALT1 mode of pad GPIO_18 for ENET_RX_CLK.

36.4.525 Select Input Register (IOMUXC_ENET_MAC0_RX_DATA0_SELECT_INPUT)

Address: 20E_0000h base + 848h offset = 20E_0848h

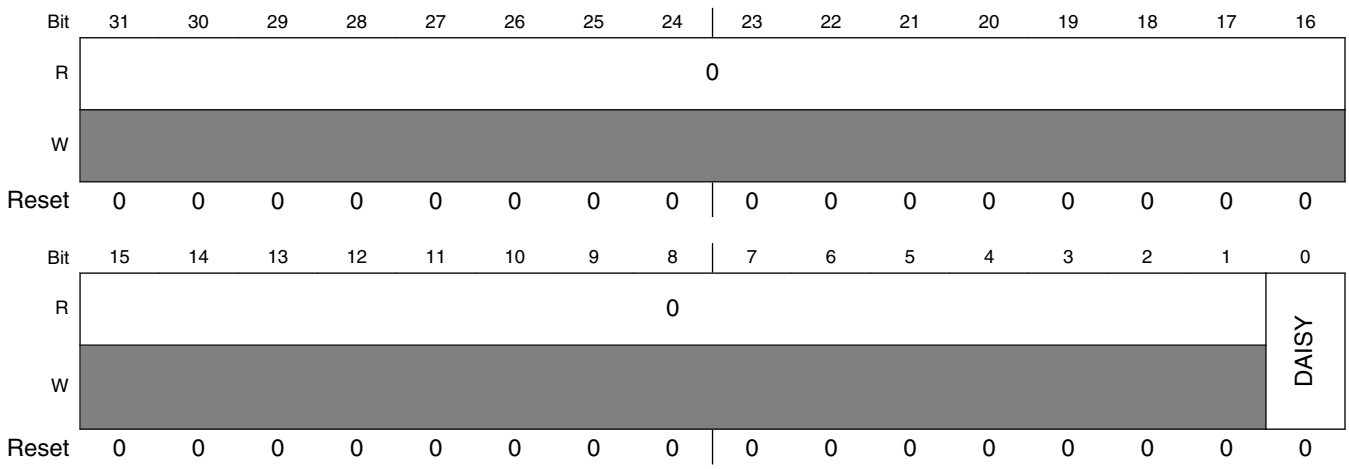


IOMUXC_ENET_MAC0_RX_DATA0_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **RGMII_RD0_ALT1** — Selecting ALT1 mode of pad RGMII_RD0 for RGMII_RD0. 1 **ENET_RX_DATA0_ALT1** — Selecting ALT1 mode of pad ENET_RXD0 for ENET_RX_DATA0.

36.4.526 Select Input Register (IOMUXC_ENET_MAC0_RX_DATA1_SELECT_INPUT)

Address: 20E_0000h base + 84Ch offset = 20E_084Ch

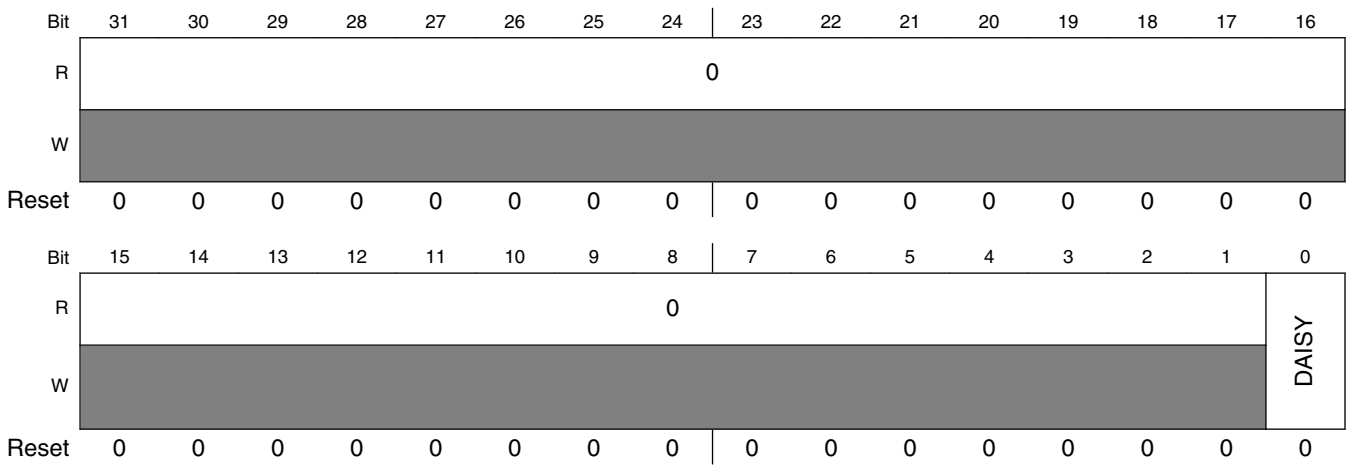


IOMUXC_ENET_MAC0_RX_DATA1_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **RGMII_RD1_ALT1** — Selecting ALT1 mode of pad RGMII_RD1 for RGMII_RD1. 1 **ENET_RX_DATA1_ALT1** — Selecting ALT1 mode of pad ENET_RXD1 for ENET_RX_DATA1.

36.4.527 Select Input Register (IOMUXC_ENET_MAC0_RX_DATA2_SELECT_INPUT)

Address: 20E_0000h base + 850h offset = 20E_0850h

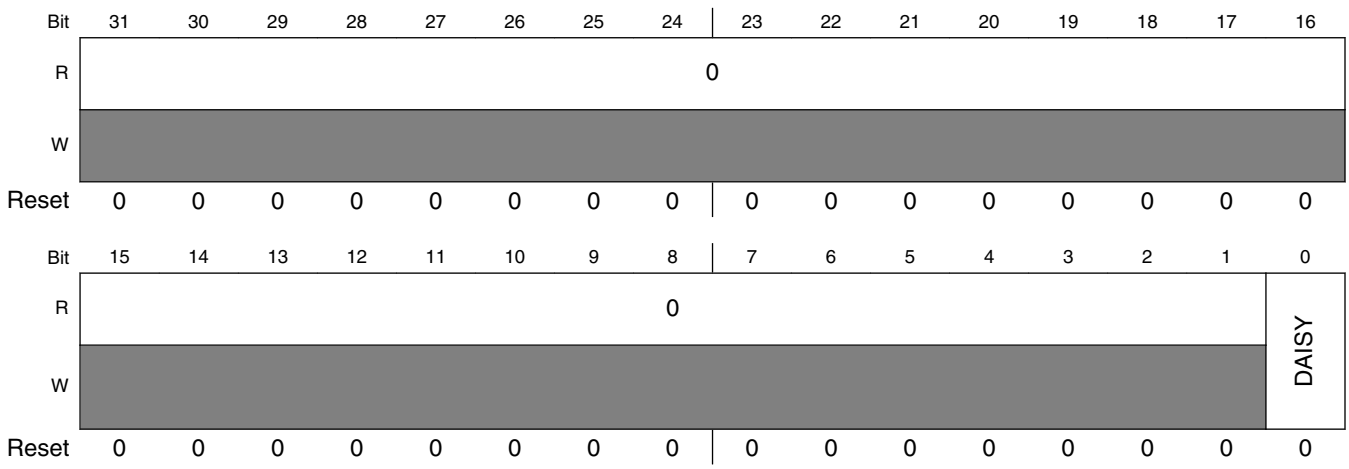


IOMUXC_ENET_MAC0_RX_DATA2_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **RGMII_RD2_ALT1** — Selecting ALT1 mode of pad RGMII_RD2 for RGMII_RD2. 1 **KEY_COL2_ALT1** — Selecting ALT1 mode of pad KEY_COL2 for ENET_RX_DATA2.

36.4.528 Select Input Register (IOMUXC_ENET_MAC0_RX_DATA3_SELECT_INPUT)

Address: 20E_0000h base + 854h offset = 20E_0854h

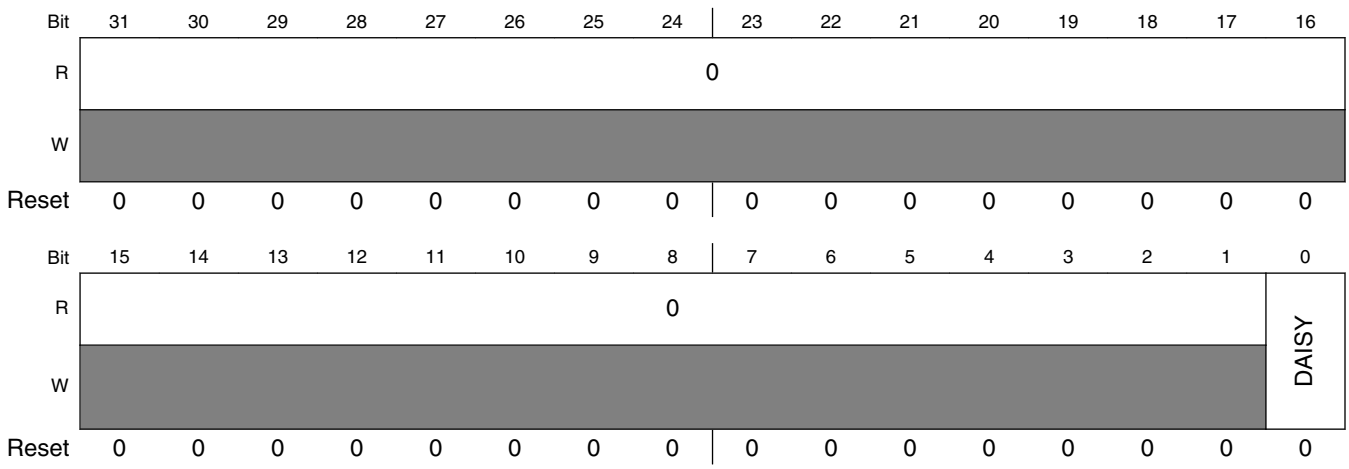


IOMUXC_ENET_MAC0_RX_DATA3_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **RGMII_RD3_ALT1** — Selecting ALT1 mode of pad RGMII_RD3 for RGMII_RD3. 1 **KEY_COL0_ALT1** — Selecting ALT1 mode of pad KEY_COL0 for ENET_RX_DATA3.

36.4.529 Select Input Register (IOMUXC_ENET_MAC0_RX_EN_SELECT_INPUT)

Address: 20E_0000h base + 858h offset = 20E_0858h

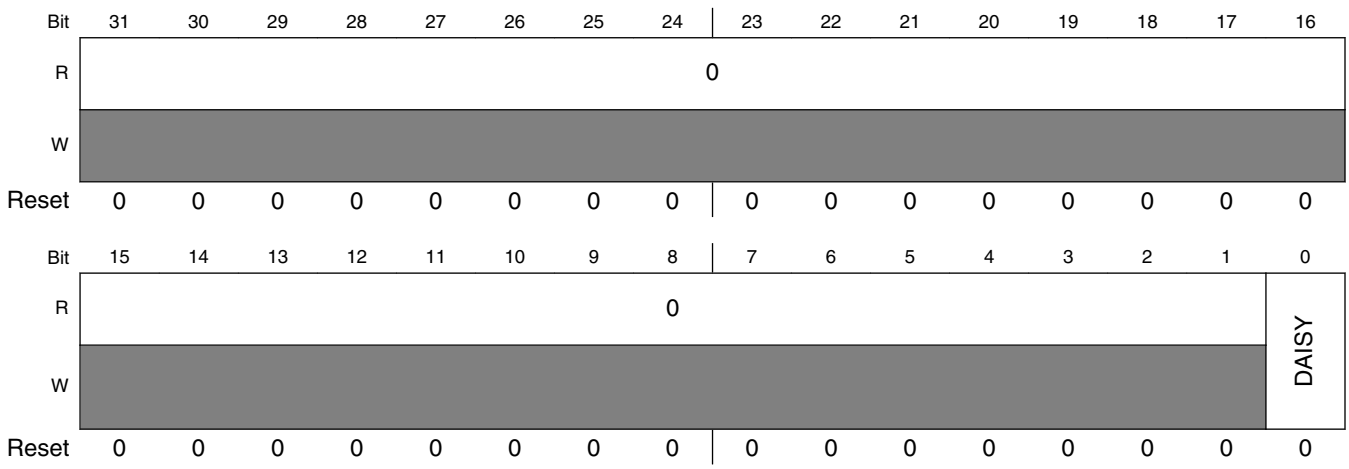


IOMUXC_ENET_MAC0_RX_EN_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **RGMII_RX_CTL_ALT1** — Selecting ALT1 mode of pad RGMII_RX_CTL for RGMII_RX_CTL. 1 **ENET_CRS_DV_ALT1** — Selecting ALT1 mode of pad ENET_CRS_DV for ENET_RX_EN.

36.4.530 Select Input Register (IOMUXC_ESAI_RX_FS_SELECT_INPUT)

Address: 20E_0000h base + 85Ch offset = 20E_085Ch

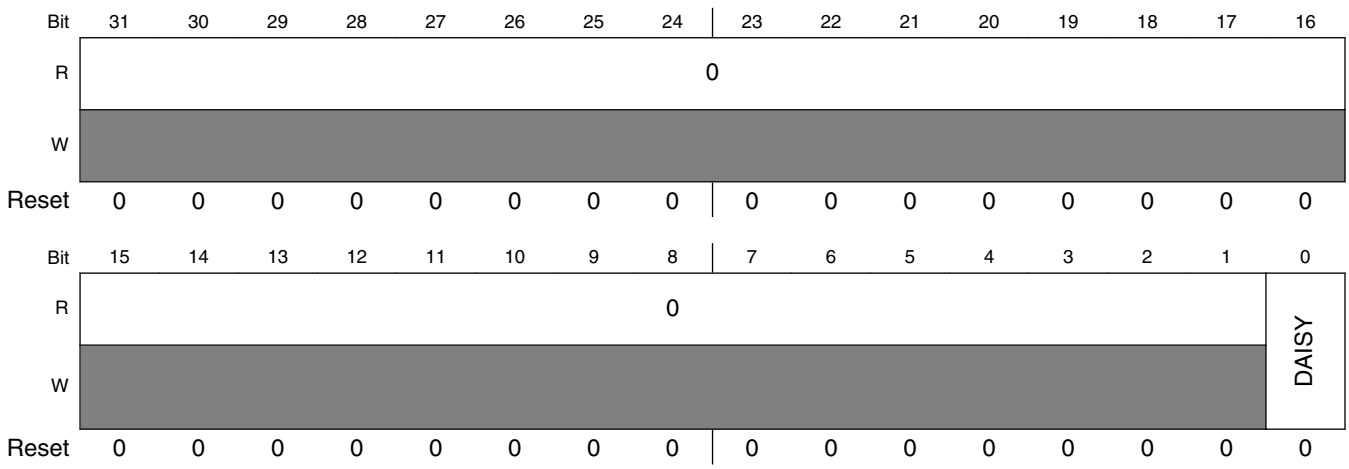


IOMUXC_ESAI_RX_FS_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **ENET_REF_CLK_ALT2** — Selecting ALT2 mode of pad ENET_REF_CLK for ESAI_RX_FS. 1 **GPIO09_ALT0** — Selecting ALT0 mode of pad GPIO_9 for ESAI_RX_FS.

36.4.531 Select Input Register (IOMUXC_ESAI_TX_FS_SELECT_INPUT)

Address: 20E_0000h base + 860h offset = 20E_0860h

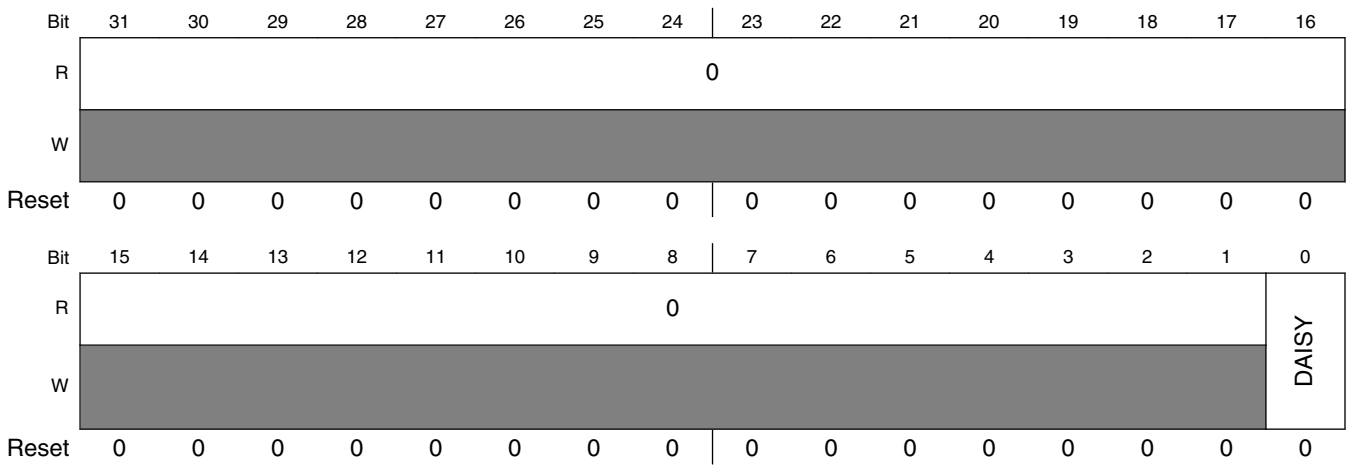


IOMUXC_ESAI_TX_FS_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **ENET_RX_DATA1_ALT2** — Selecting ALT2 mode of pad ENET_RXD1 for ESAI_TX_FS. 1 **GPIO02_ALT0** — Selecting ALT0 mode of pad GPIO_2 for ESAI_TX_FS.

36.4.532 Select Input Register (IOMUXC_ESAI_RX_HF_CLK_SELECT_INPUT)

Address: 20E_0000h base + 864h offset = 20E_0864h



IOMUXC_ESAI_RX_HF_CLK_SELECT_INPUT field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 DAISY	Input Select (DAISY) Field Selecting Pads Involved in Daisy Chain. 0 **ENET_RX_ER_ALT2** — Selecting ALT2 mode of pad ENET_RX_ER for ESAI_RX_HF_CLK. 1 **GPIO03_ALT0** — Selecting ALT0 mode of pad GPIO_3 for ESAI_RX_HF_CLK.

36.4.533 Select Input Register (IOMUXC_ESAI_TX_HF_CLK_SELECT_INPUT)

Chapter 37
Image Processing Unit (IPU)

37.1 Overview

The IPU is planned to be a part of the video and graphics subsystem in an application processor.

The goal of the IPU is to provide comprehensive support for the flow of data from an image sensor and/or to a display device. This support covers all aspects of these activities:

- Connectivity to relevant devices - cameras, displays, graphics accelerators, TV encoders and decoders.
- Related image processing and manipulation: sensor image signal processing, display processing, image conversions, etc.
- Synchronization and control capabilities (to avoid tearing artifacts).

This integrative approach leads to several significant advantages:

- Automation: The involvement of the ARM platform in image management is minimized. In particular, display refresh/update and a camera preview (displaying the input from an image sensor) can be performed completely autonomously. The resulting benefits are reducing the overhead due to SW-HW synchronization, freeing the ARM platform to perform other tasks and reduced power consumption (when the ARM core is idle and can be powered down).
- Optimal data path: Access to system memory is minimized. In particular, significant processing can be performed on-the-fly while receiving data from an image sensor and/or sending data to a display. System memory is used essentially only when a change in pixel order or frame rate is needed. The resulting benefits are reduced load on the system bus and further reduction of power consumption.
- Resource sharing: Maximal HW reuse for different applications, resulting with the support of a wide range of requirements with minimal HW.

The HW reuse mentioned above is enabled by a sophisticated configurability of each HW block. This configurability also allows the support of a wide range of external devices, data formats and operation modes. The resulting flexibility is important also because the support requirements are evolving significantly, so expected future changes need to be anticipated and accounted for.

The following further principles guided the choice of support provided by the IPU:

- For key applications that deserve and need HW support (for acceleration or low power), provide the best support (leading to an optimal implementation).
- For additional applications that can benefit from the HW, consider cost vs. benefit of making minor modifications/extensions to support them.
- For all other relevant applications (to be supported by SW), verify that their support is not degraded.
- Whenever possible, let the operating system (and its windowing system) act as it would without the IPU.

37.1.1 Architecture

A simplified block diagram of the IPU can be found here. The role of each block is described in IPU.

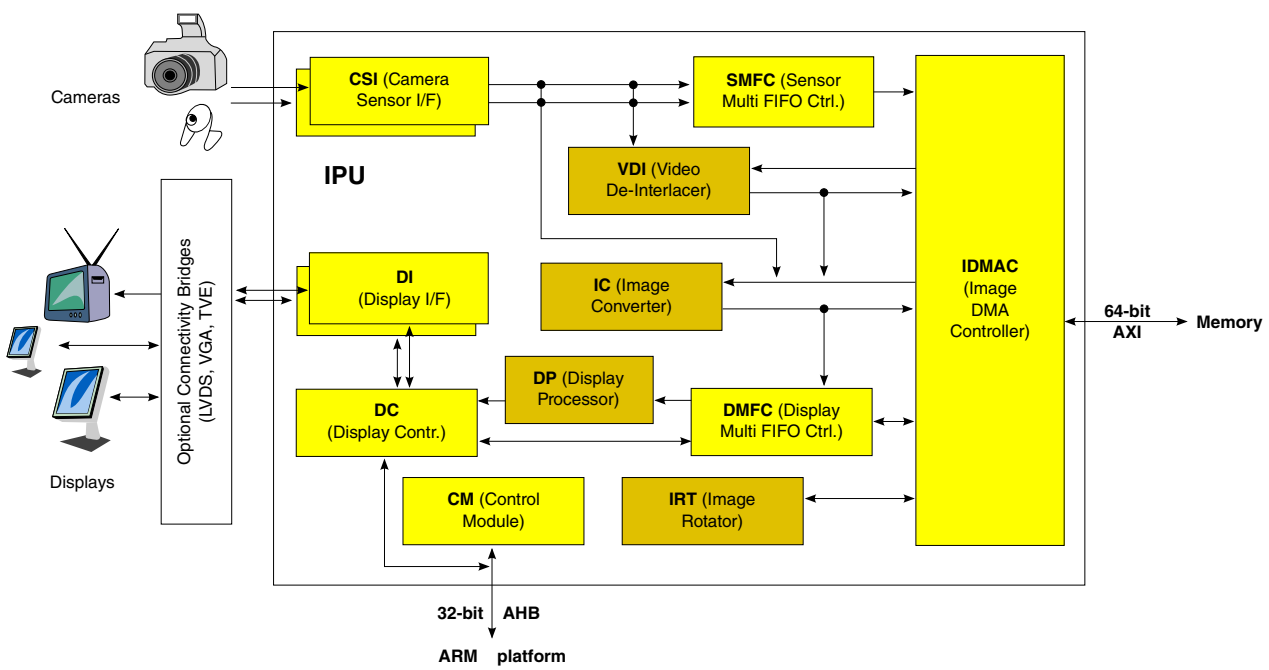

Figure 37-1. IPU Block Diagram

Table 37-1. IPU - Block Description

Block	Description
CSI - Camera Sensor Interface	Controls a camera port; provides interface to an image sensor or a related device. IPU includes 2 such blocks.
DI - Display Interface	Provides interface to displays, display controllers and related devices. IPU includes 2 such blocks.
DC - Display Controller	Controls the display ports.
DP - Display Processor	Performs the processing required for data sent to display.
IC - Image Converter	Performs resizing, color conversion/correction, combining with graphics, and horizontal inversion.
VDIC - Video De Interlacer	Performs video de interlacing (Interlaced -> progressive) or combining.
IRT - Image Rotator	Performs rotation (90 or 180 degrees) and inversion (vertical/horizontal).
IDMAC - Image DMA Controller	Controls the memory port; transfers data to/from system memory.
DMFC - Display Multi FIFO Controller	Controls FIFOs for IDMAC channels related to the display system.
CM - Control Module	Provides control and synchronization.

37.1.2 Features And Functionality

37.1.2.1 External Ports

IPU has the following ports:

- Two camera ports - each controlled by a CSI sub-block, providing a connection to image sensors and related devices.
- Two display ports - each controlled by a DI sub-block, providing a connection to displays and related devices.
- Memory port - AXI (AHB V3.0) master, controlled by the IDMAC - providing connection to the system memory.
- AHB-lite slave port, providing connection to the ARM Platform (and to any other master connected to the ARM's cross-bar switch).
- Additional ports for control and debug.

37.1.2.1.1 Camera Ports

The role of these ports is to receive input from image sensors (or TV decoders) and to provide support for time-sensitive control signals to the camera.

(Non-time-sensitive controls; configuration, reset are performed by the ARM platform through I2C I/F or GPIO signals).

Each of the camera ports includes the following features:

- Direct connectivity to most relevant image sensors and to TV decoders.
- Interface types
  - Parallel interface
    - Up to 20-bit input data bus.
    - A single value in each cycle, except for special cases listed in the table below (comments column).
    - Programmable polarity.
  - High-speed serial interface - MIPI (Mobile Industry Processor Interface) CSI-2 (Camera Serial Interface) (implemented partly in the IPU and partly in the HSC).
    - Up to four data lanes; up to 800 Mbps per lane
    - Class 1 compliancy (supporting all primary formats)
- The data formats
  - Interleaved color components, up to 16 bits per value (component).
  - The supported formats are listed in the table below.

Table 37-2. Data Formats Supported By The Camera Port

Format	Resolution	On-The-Fly Processing	Direct path to memory	Comments
Bayer RGB	8 bits/value	No	8- or 16-bit values	MIPI mandatory format
	9-10 bits/value	No	Written to the MSB of a 16-bit word	10 bits/value is a MIPI mandatory format
	16 bits/value	No		
Full RGB or YUV 4:4:4	444/555 mode	Yes, starting with color extension to 8 bits/ sample	Yes	MIPI optional formats In parallel I/F: through an 8-bit or 16-bit bus
	565 mode			MIPI mandatory format In parallel I/F: through an 8-bit or 16-bit bus
	8 bits/value (888 mode)	Yes	Yes	MIPI mandatory format
	8-16 bits/value	No	8- or 16-bit components are written to the MSB of a 16-bit word 10 bits/ value can also be packed in a 32-bit word	
YUV 4:2:2 Component order: UY1VY2... or Y1UY2V...	8 bits/value	Yes	Yes	MIPI mandatory format (UY1VY2...) In parallel I/F: through an 8-bit bus (such as BT.656) or 16-bit bus (such as BT.1120)

Table continues on the next page...

Table 37-2. Data Formats Supported By The Camera Port (continued)

Format	Resolution	On-The-Fly Processing	Direct path to memory	Comments
	9-10 bits/value	No	Written to the MSB of a 16-bit word	In parallel I/F: through a 10-bit bus (such as BT.656) or 20-bit bus (such as BT.1120)
	16 bits/value	No	Written to the MSB of a 16-bit word	
Gray scale	8 bits/value	No	Yes	
	16 bits/value	No	Written to the MSB of a 16-bit word	
Generic data		No	Yes In a parallel I/F, if wider than 8 bits, each bus word is written to the MSB of a 16-bit word	MIPI mandatory format May be used for any other formant, such as JPEG/MPEG4

- Scan order: progressive or interlaced data (expected only for YUV 4:2:2) is sent directly to system memory, where it can be read back for further processing.
- Frame size: up to 8192 x 4096 pixels
- Synchronization: video mode
  - The sensor is the master of the pixel clock (PIXCLK) & synchronization signals
  - Synchronization signals are received using either of the following methods:
    - Dedicated control signals -VSYNC, HSYNC - with programmable pulse width & polarity
    - Controls embedded in the data stream, following loosely the BT.656 protocol, with flexibility in code values and location.
- Synchronization : still image capture
  - The image capture is triggered by the ARM platform or by an external signal (such as a mechanical shutter).
  - Synchronized strobes are generated for up to 6 outputs - the sensor and camera peripherals (such as flash, mechanical shutter).
- Additional features
  - Frame rate reduction, by the periodic skipping of frames
    - The supported reduction ratios are: m:n, where m,n<=5
    - This is supported independently for the different destinations - IC, SMFC.
  - Window-of-interest selection
  - Pre-flash - for red-eye reduction and for measurements (such as focus) in low-light conditions

Several sensors can be connected to each of the CSIs. Simultaneous functionality (sending data) is supported as follows:

- Two sensors can send data independently, each through a different port, each using either parallel or fast serial interface.
- Several sensors can send data to the same port, using the MIPI interface (through a HUB), each sensor being identified by different ID's.
- Unpacking and companding capabilities are provided for up to two streams (either through same or different interfaces), while the other ones are treated as generic data.
- Only one of the (non-generic) streams can be transferred to theVDI C or IC for on-the-fly processing, while the others are sent directly to system memory.

The input rate supported by the camera port is as follows:

For parallel interface, the maximum speed of the interface is 240Mhz. The required operating frequency of the interface is calculated in the following way:

F = FH * FW * FPS * BI * DF

Where

- **FH** = frame height (in pixels)
- **FW** = Frame width (in pixels)
- **fps** = frame rate (frames per second)
- **BI** = typically 35% overhead, should be assumed as 1.35. The actual blanking intervals are a parameter of the attached device.
- **DF** = data format, defines the number of cycles needed to send a single pixel.

The number of cycles needed to send a single pixel depends on the interface and the data format.

Data format examples:

- YUV422 over 16 bit = 1 cycles/pixel
- RGB888 over 8 bit = 3 cycles/pixel
- RGB565 over 16 bit = 1 cycles/pixel
- Bayer/Generic data = 1 cycle/pixel
- YUV422 over 8 bit = 2 cycles/pixel
- BT.656, YUV422 format = 2 cycles/pixel
- BT.1120, YUV422 format = 1 cycle/pixel

Examples of supported interfaces:

- 3.2MP camera, 15fps, yuv422 format, 8 bit interface
- 1080P30, yuv422, 8 bit interface

Fast serial interface (MIPI-CSI2):

- IPU receives 2 components per cycle from the MIPI-CSI2 interface
- The maximum speed of the interface is:
  - 200Mhz for 4 data lanes configuration
  - 250Mhz for 2 data lanes configuration

The maximum bandwidth of the interface is as follows:

- 200Mhz for 4 data lanes configuration (800Mbps/lane, 400MByte/sec)
- 187.5Mhz for 3 data lanes configuration (1000Mbps/lane, 375MByte/sec)
- 125Mhz for 2 data lanes configuration (1000Mbps/lane, 250MByte/sec)
- 62.5Mhz for 1 data lane configuration (1000Mbps/lane, 125Mbyte/sec)

The required operating frequency of the interface is calculated in the same way as for parallel interface above. The DF parameter is different.

- YUV422 = 1 cycle/pixel
- RGB888 = 1.5 cycles/pixel
- Generic data = 2 bytes/pixel

Examples of supported interfaces:

- 3.2MP camera, 2 lanes configuration, 15fps, yuv422 format (~65Mhz)
- 6MP camera, 4 lanes configuration, 15fps, RGB888 format (~182Mhz)

37.1.2.1.2 Display Ports

The role of these ports is to communicate with display devices, either directly or through a controller (such as a graphics accelerator) or a bridge (such as a TV encoder or an LVDS interface bridge).

37.1.2.1.2.1 Access Modes

Two access modes are supported.

37.1.2.1.2.1.1 Synchronous Access

In this mode, the IPU transfers a two-dimensional block of pixels to the display device, in synchronization with the screen refresh cycle.

It is called "video mode" in the MIPI standards.

This mode has a dual role:

- For a RAM-less display or a TV screen, this mode is used to perform the screen refresh process from a display buffer in system memory.
- For a "smart" display, this mode is used to transfer a rectangular block of pixels to the display's screen and, in some cases, also to the display buffer
  - The transferred block may be only part of the screen (the rest of the screen being refreshed by the integrated controller, from the internal buffer). Moreover, a mask can be used to transfer to the display only parts of the block, such as a window partly hidden by other windows.
  - If the block is transferred only to the screen, the transfer rate must be equal to the refresh rate. If, however, the transfer is also to the display's memory, the rate can be reduced to the rate at which the input buffer is updated.

In all cases (including the last one), the IPU sends to the display all the synchronization signals controlling the screen refresh and the block transfer is synchronized with these signals. This synchronization means that tearing effects are avoided when using this mode.

37.1.2.1.2.1.2 Asynchronous Access

This is the main mode used for communicating with an external display controller (possibly in a smart display or a graphics accelerator).

It is called "command mode" in the MIPI standards. In this mode, the IPU performs random access - read/write - to the memory and registers of the controller.

Two types of addressing methods are supported

- Generic linear addressing of pixels and generic data
- 2-dimensional (X/Y) addressing of pixels

The following access types are provided:

- Data transfer to the external device, after on-the-fly processing in the IPU.
- Data transfer (DMA) - read/write - between the host's system memory and the external device, through the IPU's memory port (controlled by the IDMAC), such as the transfer of a rectangular block of pixels (possibly full screen).
- Host access - read/write - to an external device, through the AHB-slave port
  - Access types

    - Direct access - emulating a directly-addressed access (see below) This includes burst access (incremental; up to 8 words/burst)
    - Low-level access - leaving to the host the explicit generation of the access protocol
  - The possible accessing modules include the ARM platform and the system DMA controller (as well as any other AHB master connected to the ARM's cross-bar switch).

Transfer of video/graphics data stream to controller's display buffer is performed using one of the first two modes above. Unlike in the synchronous mode, this process is not tightly-synchronized with the screen refresh cycle. However, a loose synchronization - to avoid tearing - is still possible: the appropriate timing for the transfer can be derived from the VSYNC signal of the screen refresh - either generated by the IPU's display controller or received from the external controller.

The asynchronous access requires the specification of an address. The display interface uses "indirect addressing", namely, there is no address bus, and the address, as well as control and configuration commands, are embedded in the data stream. The access procedure - including writing addresses and commands - is managed autonomously by the interface, in one of two ways:

- Automatic emulation of transparent access, following microcode ("access template") generated by the ARM Platform. This mechanism is very flexible, supporting a wide variety of devices.
- Streaming commands/addresses from a buffer stored (by the ARM Platform) in system memory.

Note that direct access requires the use of the first method - automatic emulation.

37.1.2.1.2.2 Display Interface

The display interface is very flexible and supports a wide variety of devices from major manufacturers. The following interface types are provided (in each of the two display ports)

- Parallel video interface (for synchronous access) - up to 24-bit data bus.
  - Compatible with MIPI-DPI standard .
  - Control protocol - follows Sharp HR and generic TFT definitions
  - Supports BT.656 (8-bit) and BT.1120 (16-bit) protocols
  - Supports HDTV standards SMPTE274 (1080i/p) and SMPTE296 (720p)
- A parallel bidirectional bus interface (for asynchronous access) - up to 32-bit data bus.
  - Compatible with MIPI-DBI standard.

    - Control protocol - either system-80 or system-68K The timing and polarity of the signals are programmable.
    - Byte-enable - optional, for a 16-bit interface
    - Burst access for direct access, the burst is determined by the corresponding signal in the AHB interface.
- A serial interface - 3-wire, 4-wire and 5-wire (two flavors) (for asynchronous access)
- High-speed serial interface: MIPI (Mobile Industry Processor Interface) - DSI (Display Serial Interface) full support, with up to 2 data lanes, up to 4 virtual channels (implemented party in the IPU and partly in the HSC).

The supported formats for pixel data are

- RGB - color depth fully configurable; up to 8 bits/value (color component)
- YUV 4:2:2, 8 bits/value (for TV encoder)
- All mandatory formats in MIPI's DBI, DPI and DSI.

In the parallel interfaces, the data bus has up to 32 bits. Non-trivial mapping of pixels to the bus is restricted to the 24 LSB's. This mapping is fully configurable and very flexible. In the serial interfaces, the data is mapped in the same way as in the parallel interfaces and then serialized.

The interface also supports "generic data". Such data is transferred - byte-by-byte, without modification - between the system memory and the display device (through a serial interface or 8/16-bit parallel interface). Non-conventional pixel formats can be supported by considering them as "generic data".

For the interface clock, there are the following options (independently for each port)

- Derived from the IPU internal clock (master mode)
- Provided by an external source (slave mode)

The transfer rate supported:

- For single port (for on-chip interfaces):
    - 240 Mega-Accesses/Sec if the DI clock is derived from an external to IPU source (like another PLL)
    - 264 Mega-Accesses/Sec if the DI clock is derived from the IPU clock (HSP_CLK)
    - When off-chip interfaces are involved the rate may be limited by IO capabilities. Please refer to the device's data-sheet for exact numbers.

For synchronous access with one cycle/pixel, this enables, e.g (including 35% blanking intervals)

- 1080p (1920x1080) @ 60 fps

- WSXGA+ (1680x1050) @ 60 fps
- The combined rate for the two ports is up to 240 MP/sec

The interface includes the following additional features:

- Screen size: up to 4096 x 2048 pixels, programmable by software.
- Scan Order: progressive or interlaced
- Synchronization
  - Programmable horizontal and vertical synchronization output signals (for synchronous access)
  - Data enabling output signal
- Software contrast control using 8-bit programmable pulse-width modulation (PWM) Two dedicated PWM outputs are provided

Connecting To Display Devices

IPU allows the connectivity to multiple display devices. In particular, it supports the following setup:

- Primary LCD display; can be smart, dumb (RAM-less) or dual-port; may use fast serial, or the parallel interface or (through an integrated bridge) LVDS interface.
- Second LCD display; can be smart or dumb (RAM-less); may use fast serial, parallel or serial interface or (through an integrated bridge) LVDS interface.

Each of the above connections has independent settings - interface timing, access template, chip-select, etc.

Simultaneous functionality of the above devices is possible in each of the following ways:

- Two devices can be accessed (synchronously or asynchronously) independently, each through a different port: each using any of the available interfaces.
- Two devices can time-share asynchronous accesses through the legacy serial & parallel interfaces, using the CS signals.
- Two devices can be accessed - synchronously or asynchronously - through the same port, using the MIPI interface (through a HUB), each device being identified by different ID's.
- An asynchronous access can be performed during vertical blanking intervals of a synchronous access (screen refresh; to the same or other device).

The possibilities for simultaneous functionality by time-sharing the legacy interfaces in a single port are summarized in the following table.

Table 37-3. Simultaneous Functionality of Display Port By Time-Sharing Legacy Interfaces

	Second/Third Display Type		
Primary Display Type	**Smart Display Serial Interface**	**Smart Display Parallel Interface Asynchronous access**	**RAM-less display or TV screen**
Smart Display Parallel Interface Asynchronous access	Yes	Yes	Yes; access to the smart display is restricted to blanking intervals
Dual Port Smart Display Synchronous access	Yes	Yes, access to the secondary display is restricted to blanking intervals	Not Available
TFT RAM-less Display Or TV screen	Yes	Yes, access to the smart display is restricted to blanking intervals	Not Available
Graphics Accelerator	Yes	Yes, if the accelerator supports a chip select functionality	Not Available

37.1.2.1.3 Memory Port

The memory port is an AXI (AHB V3.0) master port, used to read/write data - typically two-dimensional blocks from/to system memory.

The interface supports the following features

- Clock rate up to 264 MHz (equal to the internal clock)
- 64-bit data bus
- The supported data formats are listed in the table below.

Table 37-4. Data Formats Supported By The Memory Interface

Format	Resolution	Input/Output	Comments
Non-interleaved YUV (in three separate buffers)	8 bits/value	both	4:4:4, 4:2:2, 4:2:0 formats
Partially-interleaved YUV (in two separate buffers)	8 bits/value	both	4:2:2, 4:2:0 formats Y buffer and UV buffer
Interleaved YUV (all color components in a single buffer)	8 bits/value	both	4:4:4 format (YUV...) 4:2:2 format (UY1VY2... or UY2VY1... or Y1UY2V...or Y2UY1V...)
Interleaved true color	8, 12,16, 18, 24, 32 bits/ pixel	both	Flexible component location A: translucency value

Table continues on the next page...

Table 37-4. Data Formats Supported By The Memory Interface (continued)

Format	Resolution	Input/Output	Comments
	0 - 8 bits per R/G/B/A value		(only in input)
Coded color (using a palette)	4,8 bits/pixel	input only	
Gray scale	8 bits/pixel	both	
	4 bits/pixel	input only	Transferred to display port
Generic data (Transparent M)	8 bits/unit	both	E.g.: From CSI to DI Compressed data to/from DP Translucency for combining

- The pixel formats are translated to/from a uniform internal format: RGBA/YUVA 8:8:8:8
- The supported ordering of bytes and pixels is little endian. For 4 bits/pixel, big endian is also supported.
- Addressing modes include:
  - Sequential access (to a contiguous memory buffer) - for generic data.
  - Raster-scan within a two-dimensional window of a video/display buffer - for both pixel and generic data.
  - Raster-scan of two-dimensional blocks within a two-dimensional window (for rotation of pixel data)
- Additional features
  - Scan order: progressive or interlaced Interlaced access is supported for fields which are stored either in separate memory buffers or with rows interleaved in a single buffer.
  - Reordered scan, implementing inversion and rotation.
    - Rotation and horizontal inversion - only when transferring two-dimensional blocks (to/from the IRT)
    - Vertical inversion - also in row-by-row raster-scan
  - Scrolling
    - Applications Panning within a frame Frame scrolling
    - Not supported for non-interleaved and partially-interleaved formats
    - Resolution Vertical: single pixel Horizontal: 18 BPP - 4 pixels; 12, 4 BPP or YUV 422 - 2 pixels; other formats - one pixel
  - Conditional read (for combining): fully-transparent or hidden pixels are not read.
    - This is supported, for graphics. by reading the transparency (alpha) from a separate buffer
  - Input/output FIFOs (in the SMFC, DMFC and in the processing sub-blocks) - size adjusted to provide resilience for latency of up to 1500 cycles.

37.1.2.1.4 Processing

The IPU processes rectangular blocks of pixels. The processing is performed in these sub-blocks - VDIC, DP, IC and IRT.

(see the IPU block diagram and Table 37-1).

37.1.2.1.4.1 Processing flows

Several time-shared data flows are supported, as described in the following table.

Table 37-5. Time-Shared Data Flows through the IPU

Name	Number	Type	Flow	Target	Restrictions
Display Refresh/ Update	5 flows (at most two of them of type DS1)	DS1	Fmem -> DP -> Display	Synchronous Access (e.g. display refresh; controlled by the DI)	
		DS2	Fmem -> DP -> Display	Asynchronous Access (e.g. display update)	
		DS3	Fmem <-> Display	Generic Data Transfer	
	1 flow	DS4	ARM Platform<-> Display	Direct Access	
Video Playback	flows	PL1	Bmem -> VDIC -> IC -> Bmem -> IRT -> Fmem + DSx	Main option	
		PL2	Fmem -> IRT -> Bmem -> IC -> DP	Low power (branching to DSx, as a video plane)	Large enough window No other video flows
		PL3	Fmem -> VDIC -> IC -> DP	Low power (branching to DSx, as a video plane)	Interlaced source Large enough window No other video flows
Camera Preview	1 flow (VF2 may be used also as a playback flow)	VF1	Sensor -> IC -> Bmem -> IRT -> Fmem+DSx	main option	Single progressive input
		VF2	Sensor -> Fmem -> VDIC -> IC -> Bmem -> IRT -> Fmem+ DSx	two inputs and/or interlaced input	When the VDIC is used, one of the three input fields can go directly from the sensor to the VDIC. In that case the sensor output goes to the memory via the VDIC and not the SMFC
		VF4	Sensor -> IC -> Fmem + DS1	Low power RAM-less Display Single Display Buffer (in internal memory) Tearing-less	Single progressive input Refresh rate = 2x sensor frame rate Large enough window No other video flows
Video Record	1 flow	RCx	IC -> Bmem -> IRT -> Fmem	(branching from VFx)	

Table continues on the next page...

Table 37-5. Time-Shared Data Flows through the IPU (continued)

Name	Number	Type	Flow	Target	Restrictions
Graphic Overlays	2 flows	GF1	Fmem -> IC	(combining with the main flow	
	2 flow	GF2	Fmem -> DP		

Comments

- System memory usage - legend
  - Fmem: frame double-buffer (page-flip) in system memory (typically external memory: DDR DRAM [address 0x1000_0000 - 0xFFFF_FFFF])
  - Bmem: two possibilities
    - A frame double buffer, as above
    - A band (4-256 rows) double-buffer (page-flip) in system memory (could be internal memory: OCRAM [address 0x0900_0000 - 0x093F_FFFF])
  - Direct arrow between two processing stages represents an internal pipeline
- Time-sharing
  - IC can time-share tightly three flows: one VFx, one RCx and one PLx (with independent processing parameters)
  - DP can time-share one DS1 flow and a one DS2 flow (each with different destinations and independent processing parameters)
  - Direct access to display (DS4) time-shares tightly the display port with other active DSx flows.
  - Other time-sharing (between PLx flow and DS2 and DS3 flows in IRT) is frame-by-frame
- Any of the processing stages in the above flows can be skipped.
- Triggering and synchronization
  - Flow segments starting from a sensor are triggered and synchronized by input from the sensor
  - Flow segments ending with display refresh are triggered and synchronized by the refresh control mechanism in the DI.
  - Flow segments starting and ending in system memory, are triggered either by the double buffering mechanism or by explicit configuration and are processed continuously without delay, at a rate determined by the available resources. These flow segments have a lower priority than the sensor/display-driven flows.

The functionality of each of the processing blocks is described below.

37.1.2.1.4.2 Display Processor (DP)

The Display Processor performs all the processing required for data sent to a display.

- Input: from the IC and/or from system memory

- Order: rows, progressive or interlaced
- Format: YUVA/RGBA, non-decimated, 8 bits/value

- Processing chain
  - Combining 2 video/graphics planes
  - Overlaying a simple HW cursor 32 x 32 pixels, uniform color; may be combined logically with the full plane.
  - Color conversion/correction - linear (multiplicative & additive) programmable including:
    - YUV <-> RGB, YUV<->YUV conversions where YUV stands for any one of the color formats defined in the MPEG-4 standard
    - Adjustments: brightness, contrast, color saturation, etc.
    - Special effects: gray-scale, color inversion, sephia, blue-tone, etc.
    - Color-preserving clipping, for gamut mapping
    - Hue-preserving gamut mapping - for minimal color distortion
    - Applied to the output of combining or to one of the inputs
  - Gamma correction and contrast stretching - programmable piecewise-linear map
- Output: to display (through the DC)
  - Rate: up to 240M pixels/sec
  - Format: YUV/RGB, non-decimated, 8 bits/value

The DP processes a single data flow at any given time, but supports up to three data flows by time sharing.

- A Primary flow:
  - The input is loaded periodically using a timer (e.g. for a synchronous access)
  - Optionally, frames are skipped if the content has not changed (as appropriate for a smart display)
- Two secondary flows:
  - Asynchronous; processed when the DP is not needed for the primary flow (during blanking intervals or when a primary frame is skipped).
  - The two secondary flows are switched frame-by-frame.

37.1.2.1.5 Video De-Interlacer or Combiner (VDIC)

The Video De-Interlacer as well as the Combiner have two operation modes

- De-interlacing: converts an interlaced video stream to progressive order.
- Combining: combines two video/graphics planes and a background color

37.1.2.1.5.1 De-interlacing in the VDIC

The Video De-Interlacer converts an interlaced video stream to progressive order, using a high-quality 3-field motion-adaptive filter.

- Video source - SDTV: 480i30 (720x480 @ 30 fps) or 576i25 (720x576 @ 25 fps) and HDTV: 1080i/30 (1920x1080 @ 30 fps)
- Input: -three consecutive fields
  - Source
    - The most recent field may come from the CSI or from system memory
    - The other two fields are read from memory
  - Field size: up to 968x1024 pixels (may be a vertical stripe of a wider field; e.g. 1920 pixels)
  - Pixel format: YUV 4:2:2/4:2:0, 8 bits/value
- Output: progressive frame
  - Destination: to system memory or to the Image Converter.
  - Frame size: up to 968x2048 pixels
  - Rate: up to 240 MP/sec (e.g., 1920x1080 @ 85 fps)
  - Format: same as input format

The de-interlacing is performed using a high-quality 3-field filter which is motion adaptive:

- For slow motion - retains the full resolution (of both top and bottom fields)
- For fast motion - prevents motion artifacts

The VDIC supports a single video stream at any given time.

37.1.2.1.5.2 Combining in the VDIC

- Input for combining: two progressive video/graphics planes
  - Source: system memory
  - Plane size: up to 1920x1200 pixels.
  - Pixel format: RGB/YUV 4:2:2, 8 bits/value

In this mode:

- The two input planes are read from system memory, using the previous field and next field input FIFOs.
- Their relative height, up/down is configurable
- Each of them may cover only part of the output frame. For the remaining part of the frame, the chip uses the following values:
  - Down plane: a 24-bit background color, stored in an internal register
  - Up plane: a transparent pixel
- The combining method is identical to the one in the DP, IC.

37.1.2.1.5.3 Image Converter (IC)

The Image Converter performs various operations on a video stream.

- Input: from sensor or from system memory
  - Frame size: up to 4096x4096 pixels
  - Rate: up to 200M pixels/sec (e.g. 5 MP @ 30 fps + 35% blanking intervals)
  - Order: rows, progressive. If resizing is not used, interlaced order is also acceptable.
  - Pixel format: YUV/RGB, 8 bits/value
- Processing chain:
  - Resizing
    - Fully flexible resizing ratio Maximal downsizing ratio: 8:1. Subject to this limitation, any N->M resizing can be performed.
    - Independent horizontal and vertical resizing ratios.
  - Color conversion/correction - linear (multiplicative & additive) programmable, including:
    - YUV <-> RGB, YUV<->YUV conversions where YUV stands for any one of the color formats defined in the MPEG-4 standard
    - Adjustments: brightness, contrast, color saturation...
    - Special effects: gray-scale, color inversion, sephia, blue-tone...
  - Combining with a graphics plane (e.g. application-specific overlay)
  - Horizontal inversion
- Output: to system memory or (for a single active flow) to a display device (through the DP).
  - Frame size: up to 1024x1024 pixels
  - Rate: up to 100Mpixels/sec (e.g. 1920x1080 @ 30 fps)
  - Order: rows, progressive. If resizing is not used, interlaced order is also acceptable.
  - Format: YUV/RGB, 8 bits/value

The IC supports three time-shared data flows: record, camera preview and playback (the first two share a common input).

37.1.2.1.5.4 Image Rotator (IRT)

- Input/output: from/to system memory
  - Rate
    - Up to 120M pixels/sec (when a single task is active).
    - Up to 100M pixels/sec (when more than one task is active).
  - Order: raster scan of 8x8-pixel blocks
  - Format: YUV/RGB, non-decimated, 8 bits/value
- Transformation: combination of the following
  - 90-degree rotation
  - Horizontal inversion
  - Vertical inversion

37.1.2.1.6 Automatic Procedures

The IPU is equipped with powerful control and synchronization capabilities to perform its tasks with minimal involvement of the ARM Core and minimal use of memory.

In particular, it includes:

- An integrated DMA controller with an AXI master port, allowing autonomous access to the system memory.
- An integrated display controller, performing screen refresh of a RAM-less display.
- A page-flip double buffering mechanism, synchronizing read and write access to system memory, to prevent tearing effects.
- A double/triple buffer synchronization mechanism with a video/graphics source.
- Internal synchronization, e.g., between input from sensor and output to display

As a result, in most cases, the ARM platform is involved only when it also performs part of the processing (e.g. video coding). In particular, the following procedures are performed by the IPU completely autonomously:

- Screen refresh for RAM-less displays
- Update of the ("partial plane") display buffer used for screen refresh (located either in system memory or in an external display controller, e.g. of a smart display or graphics accelerator), when the content is generated in a different ("full plane") buffer.

Typically, there are extended periods of times in which there is no other activity in the system. The ARM platform, being idle, can be put to a low-power mode, reducing the power consumption and extending significantly the battery life.

The IPU supports several techniques to reduce further the power consumption of the display system:

- Dynamically optimized screen refresh rate (see Screen Refresh below)
- Optimized update of the display buffer (see Update Of The Display Buffer below)
- Dynamic backlight control, with low-light compensation by image enhancement

Further features and capabilities of the automatic procedures are outlined below

37.1.2.1.6.1 Screen Refresh

- The refresh rate may vary within a predefined range. Within this range, the rate is dynamically adjusted to the content update rate.
- An indication about the availability of new content is obtained as follows:

- If the page-flip double buffering is used, the mechanism provides this indication
- If only a single buffer is used (and incrementally updated), the IPU can receive an indication of a modification from the ARM platform (by setting an internal flag).

- The IPU counts the refresh cycles: the total and those with new content. The ARM platform can use these counters to optimize display management (e.g. switching display buffer compression on/off). The counters are reset by the ARM platform.
- The transferred data may be processed on the way, using the IC and DP.

37.1.2.1.6.2 Update Of The Display Buffer

- Conditional update The IPU can receive an external "snooping" signal indicating a modification of the full plane buffer (as during screen refresh above). It monitors the signal and, upon detection, it performs one of the following:
  - Performs an update, without any SW intervention
  - Interrupts the ARM core, that can initiate some more involved procedure (e.g. selective update)
- Automatic display of a changing image (animation) or moving image (scrolling) This is implemented by reading frames (from a full plane buffer) with incremental offset. When the IPU reaches the last programmed frame, it can perform one of the following:
  - Return to the first frame, without any SW intervention
  - Interrupt the ARM platform, to generate the next content.
- The timing of the update can be adjusted to avoid tearing.
- The transferred data may be processed on the way, using the IC and DP

37.1.2.1.6.3 Camera Preview

- Tearing artifacts can be prevented by (automatic) page-flip double buffering in system memory
- Alternatively, the video stream from an image sensor can be sent directly to the display buffer used for screen refresh. The significance of this option is that only a single frame buffer is needed (and not two). This buffer may be located either in system memory or in an external display controller.
  - This option is useful, e.g., in a low frame rate, when tearing is not visible.
  - When tearing must be prevented, the refresh cycle in the display can be synchronized with the timing signals from the sensor (two refresh cycles for each input frame): the IPU receives a VSYNC signal from the sensor and generates from it synchronization signals for the display.

37.2 External Signals

The table found here describes the external signals of IPU1.

Table 37-6. IPU1 External Signals

Signal	Description	Pad	Mode	Direction
IPU1_CSI0_DATA00	-	EIM_D27	ALT2	I
IPU1_CSI0_DATA01	-	EIM_D26	ALT2	I

37.4.2.2 IBIW & IBIR - Internal bus interface for write and read

The Internal Bus Interface handles the internal IPU protocol communicating between the IDMAC and the IPU's sub modules.

The IBIR handles channels that perform read from external memory. The IBIW handles channels that perform write accesses to external memory.

37.4.2.3 FCW & FCR - Format converter write and read

The format converter performs packing ("write direction") / unpacking ("read" direction) of pixels with programmable position and width of color components, decoding 4- or 8-bits coded pixels according to a loaded look-up table, panning of an image read from the system memory according to a panning offset (start pixel address).

The format converter supports formats with a pixel width of 4, 8, 12, 16, 18, 24 or 32 bits. The format converter unit handles two pixels simultaneously.

The IPU sub modules can handle only the formats, presented below. Each component is 8 bit:

Figure 37-4. IPU internal pixel formats

The pixel can be stored in the memory in the formats presented below. (R/G/B means that this could component can be R or G or B; A is the location of the alpha component).

For Read:

R/G/B/A	R/G/B/A	R/G/B/A	R/G/B/A

For Write:

R/G/B	R/G/B	R/G/B	A

A	R/G/B	R/G/B	R/G/B

Figure 37-5. IPU external pixel formats

Formatting parameters are written in the channel parameter memory (CPMEM - Channel Parameter Memory). The following parameters are used:

- Offset OFS0 between MSB position of the color component 0 and MSB position of packed pixel. The color component 0 occupies the most significant bits of the unpacked pixel (mostly this is the R component). The OFS0 range is from 0 to 31.
- Color component 0 width (WID0 minus 1).
- Offset OFS1 between MSB position of the color component 1 and MSB position of packed pixel. The color component 1 occupies the middle left bits of the unpacked pixel (mostly this is the G component). The OFS1 range is from 0 to 31.
- Color component 1 width (WID1 minus 1).
- Offset OFS2 between MSB position of the color component 2 and MSB position of packed pixel. The color component 2 occupies the middle right bits of the unpacked pixel (mostly this is the B component). The OFS2 range is from 0 to 31.
- Color component 2 width (WID2 minus 1).
- Offset OFS3 between MSB position of the color component 3 and MSB position of packed pixel. The color component 3 occupies the least significant bits of the unpacked pixel (mostly this is the A component). The OFS3 range is from 0 to 31. For write specified DMA channels, the OFS3 value is set to 24 or 0 bits.
- In cases of read with separate alpha (alpha is located in a separate buffer in the system's memory than the pixel data), the alpha component size is defined according to WID3.

The figures below show examples of data packing and unpacking.

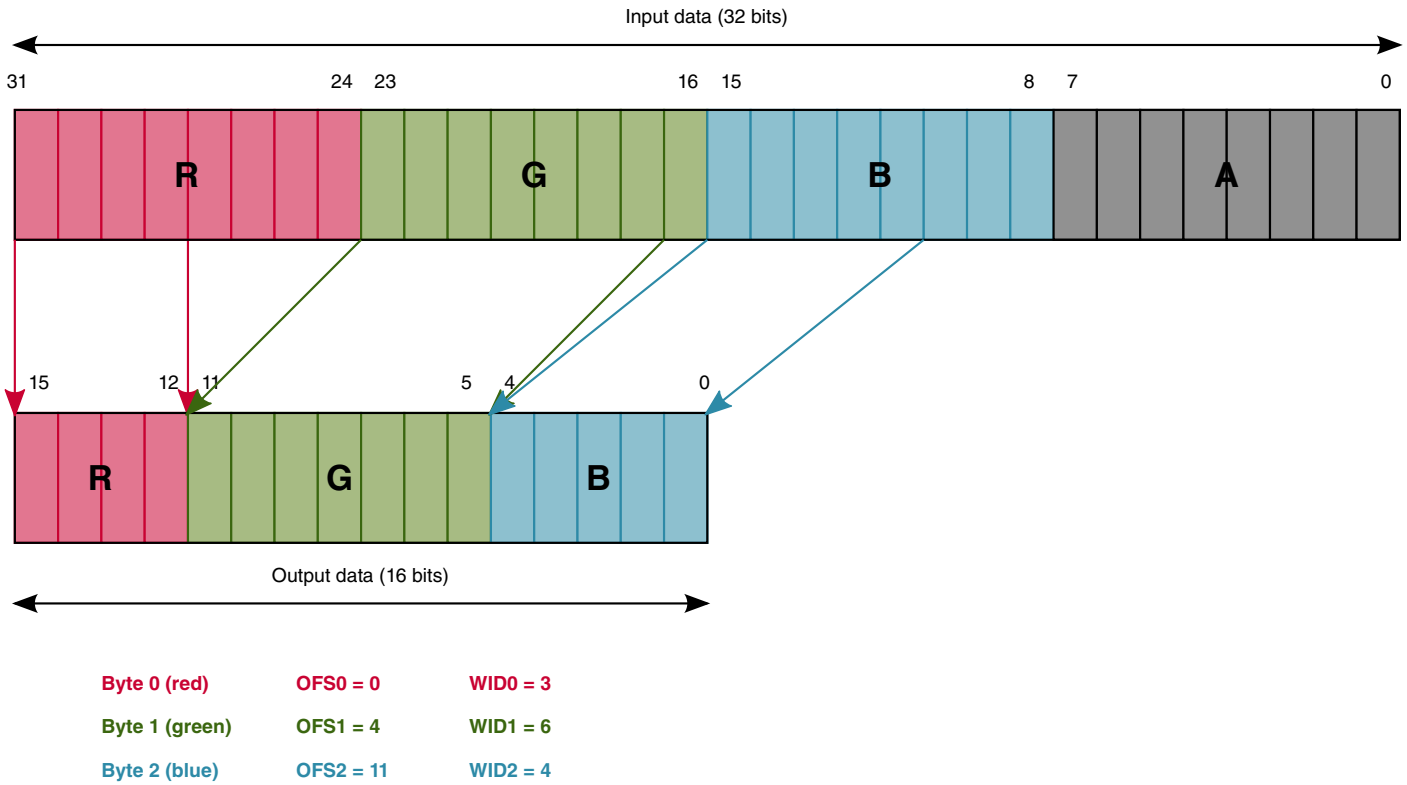

Figure 37-6. Data Packing Example

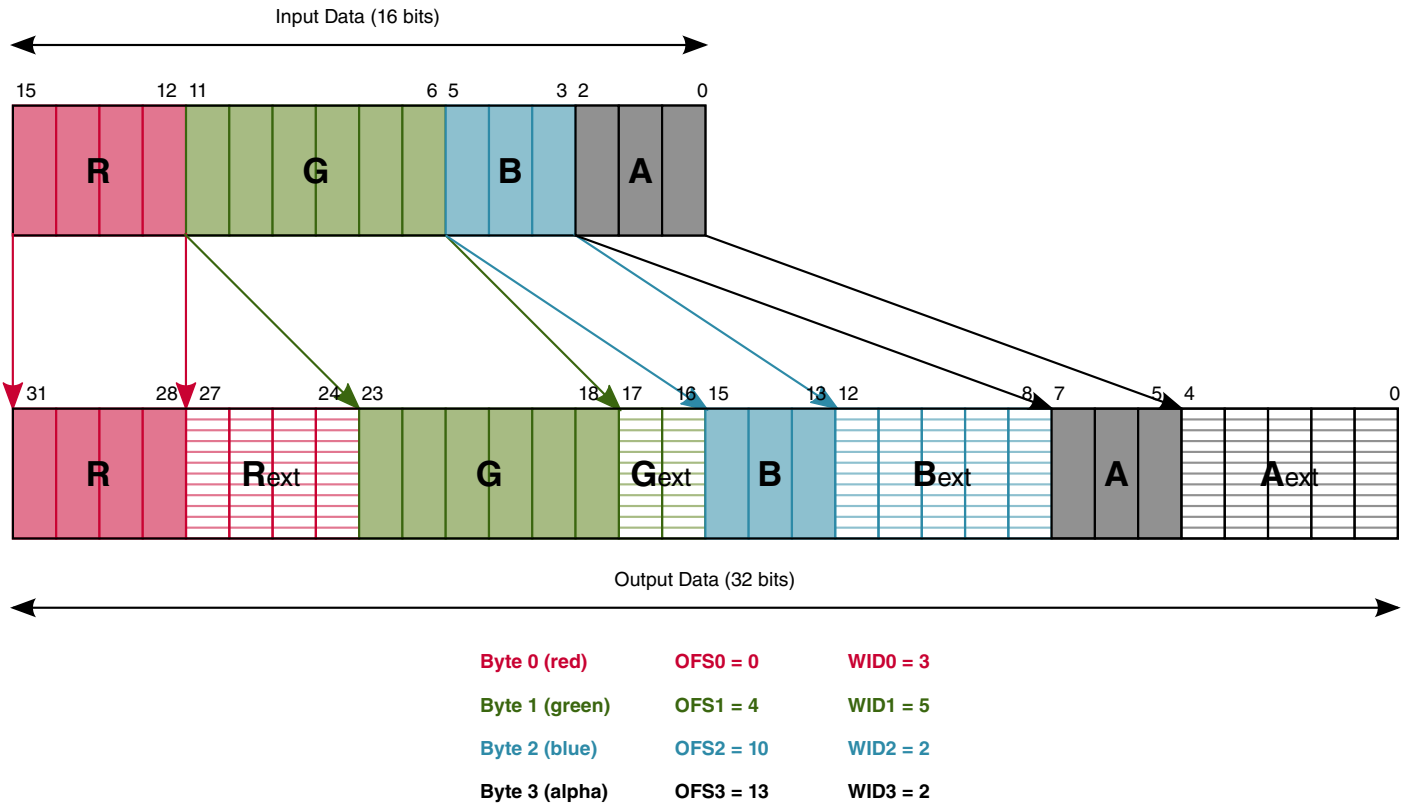

Figure 37-7. Data Unpacking Example

If read data has the coded format, it is decoded via the look-up table. The Look-Up Table Memory (LUT- Look Up Table) must be loaded at the IDMAC initialization step. The LUT output format must match the IPU internal format RGBA 8888 where R is placed in MSB and A is placed in LSB. The A field is used only for graphics data.

37.4.2.4 Buffering units

The buffering units (BUFW, BUFR) are used to store the data consisting of different coded color components.

- On write transactions (BUFW), before writing to memory & after the format has been coded.
- On read transactions (BUFR), after reading from memory & before the format has been decoded.

Each buffering unit includes 4 X 64 bytes buffers. Each buffer, for each direction, can handle any kind of color component (interleaved - Y / partial interleaved - Y, UV / non interleaved - Y, U, V).

The Write buffers are controlled by the buffer controller for write (BCW) and AXIW units.

The Read buffers are controlled by the buffer controller for read (BCR) and AXIR units.

37.4.2.4.1 Handling real time channels

The memory controller connected to the AXI bus of the IPU can use the AXI ID associated with each burst in order to distinguish between real time and non real time channels.

In order to do that, the user has to set the channel's ID according to the settings in the memory controller and set the priority of the channel according to its nature. The buffer controller (BCW/BCR) holds all the pending requests that won the arbitration. However, as the memory controller can distinguish between the real time channels and non real time channels within the IPU, there could be a situation where the real time requests are blocked as the IPU's queue is filled with non real time requests. To avoid that, the user can limit the number of non-real time requests in the queue.

The queue for read requests can handle up to 8 requests. The queue for write requests can handle up to 6 requests. The user can limit the number of non real time requests by setting the USED_BUFS_MAX_W for write requests and USED_BUFS_MAX_R for read requests. The feature that limits the number of requests is enabled by setting the USED_BUFS_EN_R bit for the read requests and USED_BUFS_EN_W for the write requests.

37.4.2.5 AXIW - AXI Write and AXIR - AXI Read

The AXI Master Interfaces are responsible for data transfer from/to the system memory. The Interface supports only 64-bits burst accesses of 1-8 words, with nonalignment of a byte resolution.

2 separate & independent AXI masters are used for "read" (AXIR) & "write" (AXIW), each can be programmed (via CPMEM) with 4 different IDs to support out-of-order accesses within bursts.

37.4.2.6 CC_W & CC_R - Channel Control Write and Read

The Channel Control unit is the main control unit of the IDMAC.

- It arbitrates the channels according to the priority.
- Controls the address arithmetic unit.

- Functions as a memory interface to the CPMEM. It reads the parameters from the CPMEM, prepares the controls accordingly and writes back updated parameters to the CPMEM.
- The read unit provides the parameters to the IBIR unit
- The write unit provides the parameters to the AXIW unit

The CC calculates all the parameters related to the access except the address and BS (burst size), which are calculated at the AAU.

The priority is set according to:

- The channel's corresponding bit in the IDMAC_CH_PRI_1 & IDMAC_CH_PRI_2 registers.
- The watermark signal generated from the sub module. The watermark signal is ignored unless the channel's corresponding IDMAC_WM_EN bit is set.
- Special priority for alpha channels

A priority value is calculated for each of the enabled channels according to the above conditions. Then, the CC unit selects between the channels with the same priority value in a round-robin fashion.

Table 37-11. Calculated priority value

alpha channel	Channel's priority bit	watermark signal	Priority Value
0	0	0	0
0	0	1	1
0	1	0	2
0	1	1	3
1	0	0	1
1	0	1	2
1	1	0	3
1	1	1	4

37.4.2.6.1 Locking the arbitration and reordering the AXI bursts

The performance of the overall system can be improved by sending AXI bursts of consecutive addresses. This can be done by reordering the AXI bursts in a way that accesses that belong to the same channel will be sent one after the other. This can be done by controlling the IDMAC_LOCK_# bits of the corresponding channel.

An IDMAC request that won the arbitration will be served for the next bursts according to the settings of the IDMAC_LOCK_# bits. The block that issued the request (DMFC on IPU) will assert the request only if it has enough room in its FIFO to accept the number

of bursts defined by the IDMAC_LOCK_# bits. IPU provides this capability to channels that serve real time screen refresh to synchronous display (23,27,28). In addition, it provides this capability to channels that may generate very short AXI bursts (IC and IRT)

37.4.2.7 AAU_W & AAU_R- Address Arithmetic Unit for Write and Read

The AAU_R & AAU_W units calculate the address in the system memory to be accessed by the IPU. These units also calculate the burst size (BS). The address calculation is done according to parameters stored in the CPMEM.

The following main addressing parameters are used:

- XB-Horizontal pixel position in frame
- YB-Vertical pixel position in frame
- SL-Stride line minus 1 (gap in bytes between two pixels in the same column in two consecutive rows).
- SX-Horizontal pixel scrolling offset
- SY-Vertical pixel scrolling offset
- EBA-Frame buffer base address in bytes (there are two such parameters to support double buffering)
- BPP-Bits per pixel
- FW-Frame width minus 1
- FH-Frame height minus 1

Relations between the addressing parameters and image frame are shown in the table below.

The system memory address in bytes is calculated as:

ADDR = EBA + (XB + SX) * BPP + (YB + SY) * (SL + 1)

with 0 < XB <= FW and 0 < YB <= FH.

For non-interleaved formats the 4 LSB bits of SX are defined according to the IOX parameter.

When double buffering is used, the EBA0 is the base address of the buffer 0 and the EBA1 is the base address of the buffer 1. The IPU_CHA_CUR_BUF Register is a status register. It contains 1-bit pointers to the current working buffers for all IPU DMA channels. The IPU automatically toggles a pointer after completion of the current buffer processing. If the ARM platform is a data source for specific double-buffered channel, it should check this status bit in order to know what is the IPU current buffer. The ARM platform is allowed to write to the buffer only when a working DMA channel does not

use it. After the ARM platform has been fill the buffer, it has to set the corresponding bit in the IPU_CHA_BUF0_RDY and IPU_CHA_BUF1_RDY Registers. If needed, the ARM platform can only clear the pointer by writing 1 but not set it.

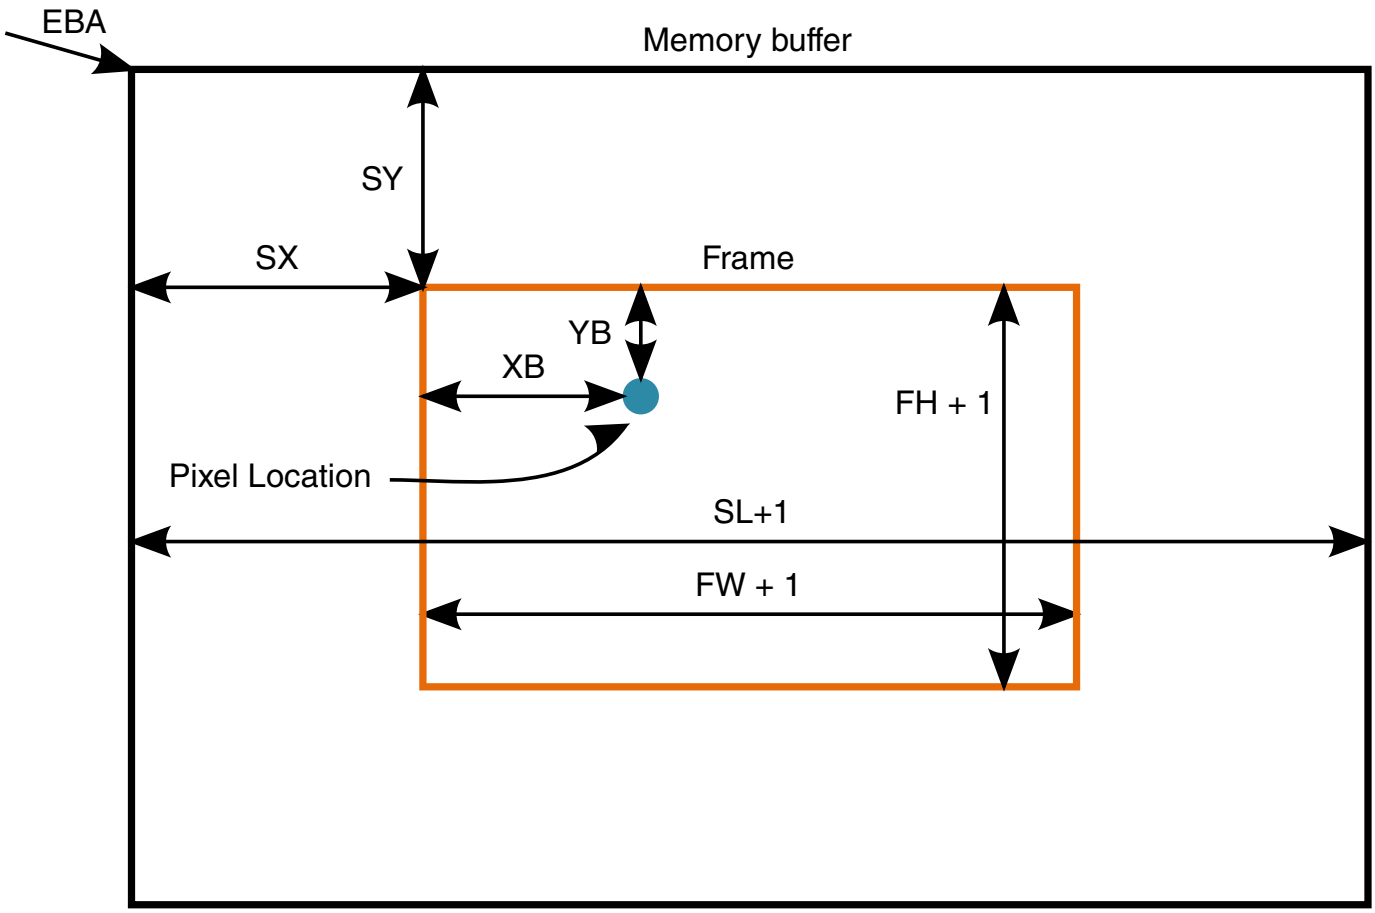

Figure 37-8. Addressing Parameters and Image Frame

The XB and YB coordinates are calculated according to addressing mode. There are two addressing modes:

- 2D mode
- Block mode

In 2D mode the pixel data is transferred to the memory row-by-row. There are two ways to use 2D mode: start from YB = 0 and finish at YB <= FH (YB is incremented) or start from YB = FH and finish at YB <= 0 (YB is decremented). The second option provides vertical flip of the image.

In block mode the frame is divided into blocks. This is needed for rotation or post-filtering, where the order used for data transfers is block-by-block. The order of the block transfer is according to the VF,HF and ROT bits in the IDMAC Channel Parameter

Memory. The order within the block is row-by-row where the block size is limited by the block width (BW) and block height (BH) parameters. The BW and BH parameters are set by IC rotation section and cannot be configured through the Channel Parameter Memory.

The Channel Control is responsible for the address calculation flow. It takes channel parameters from the Channel Parameter Memory, updates them and controls the Address Arithmetic Unit.

37.4.2.7.1 Scrolling support

Automatic display of a changing image (animation) or moving image (scrolling) is implemented by reading frames (from a background buffer) with incremental offset. Enabling the scrolling feature is done by setting the channel's corresponding SCE bit.

The scrolling step is controlled by channel's corresponding SDX and SDY parameters, and the scrolling direction is defined by the channel's corresponding SDRX and SDRY parameters. The maximum number of scrolled frames to be read is defined by the channel's corresponding SM parameter.

When the last programmed frame is reached (IDMAC's internal counter reached SM), IDMAC can perform one of the following (controlled by the SCC bit):

- Return to the first frame, without any SW intervention. The return point is defined by SX0 and SY0 parameters.
- Interrupt the ARM platform, to generate the next content.

37.4.2.8 ATC - Alpha Transparency Controller

The Alpha transparency controller (ATC) handles the alpha buffers on the external memory for cases where the pixel data and the alpha data are located on separate buffers (separate alpha mode).

In that case the IDMAC reads the alpha data and the pixel data, merge them together and provides a pixel that includes the alpha information to the relevant sub module. The ATC's main functions are:

- Generates requests for alpha channels, following a request to pixel data from the module.
- Maintain an internal alpha memory buffer for each channel.
- When there isn't enough alphas in the memory the ATC blocks the corresponding pixel channels.
- When there is a request of pixel channel the ATC load and accumulate its alphas in a register.

- ATC memory controller can manage 8 channels of alphas.
- ATC supports synchronous new frame before end of frame errors.

In order to configure the channel to use separate alpha the channel's corresponding IDMAC_SEP_AL bit should be set in addition to the ALU bit in the CPMEM of the corresponding channel.

The following figure is the ATC's block diagram.

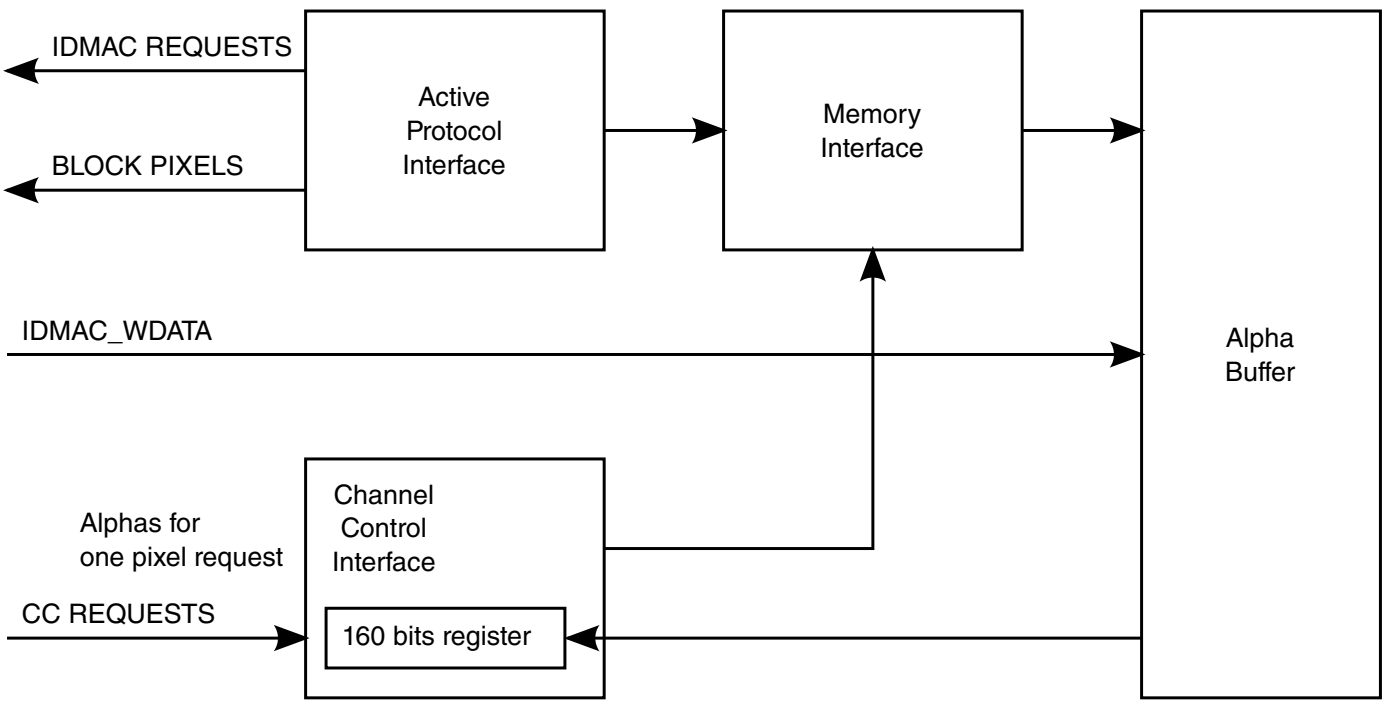

Figure 37-9. ATC block diagram

The ATC alpha buffer memory can hold up to 8 buffers of alphas. A pointer to a buffer in the ATC memory is defined according to the ALBM parameter in the CPMEM. The table below describes the relations between a data channel, an alpha channel and the pointer in the alpha buffer memory.

Table 37-12. Alpha channels mapping

data channel number	associated alpha channel number	Alpha buffer memory (ALBM)
14	17	0
15	18	1
27	31	2
29	33	3
23	51	4
24	52	5
25	19	6

37.4.2.8.1 Conditional read

The alpha data can be used to reduce reads from the memory of pixels that are going to be transparent (alpha = 0). The conditional read feature is enabled by the CRE bit in the CPMEM.

If all of the corresponding alpha values for a single burst of pixels are equal to zero, the IDMAC will block the access to the external memory and provide a data of all zeros to the corresponding channel. This way some of the accesses to the memory can be prevented, thus reducing the load on the memory.

37.4.2.9 LUT- Look Up Table

When working in coded pixel format, the data read from the memory is the decoded value of pixel according to address given. In case of 8 bit code, the data read from the memory is the decoded value of the pixel according to the address given.

In case of 4 bit code configuration, The address of the 4 bit decoded values is set according to DEC_SEL parameter in the CPMEM

00 = addresses 0 to 15

01 = addresses 64 to 79

10 = addresses 128 to 143

11 = addresses 192 to 207

Table 37-13. Look-Up Table Memory Structure

Address	Word	DEC_SEL	Description
0	Word0	4 BPP = 00 8 BPP = don't care	Decoded Pixels [15:0] for both 8 and 4 bit coded configuration
...	...		
15	Word15		
16	Word16	don't care	Decoded Pixels [63:16] for 8 bit coded configuration only
...	...		
63	Word63		
64	Word64	4 BPP = 01 8 BPP = don't care	Decoded Pixels [79:64] for both 8 and 4 bit coded configuration
...	...		
79	Word79		
80	Word80	don't care	Decoded Pixels [127:80] for 8 bit coded configuration only

255	Word255		

37.4.2.10 CPMEM - Channel Parameter Memory

The CPMEM holds the configuration parameters for each IDMAC channel. The CPMEM can holds the settings of 80 channels.

Each channel's settings are defined by a two mega-words. Each mega-word is 160 bits wide. The following diagram illustrates the CPMEM's structure.

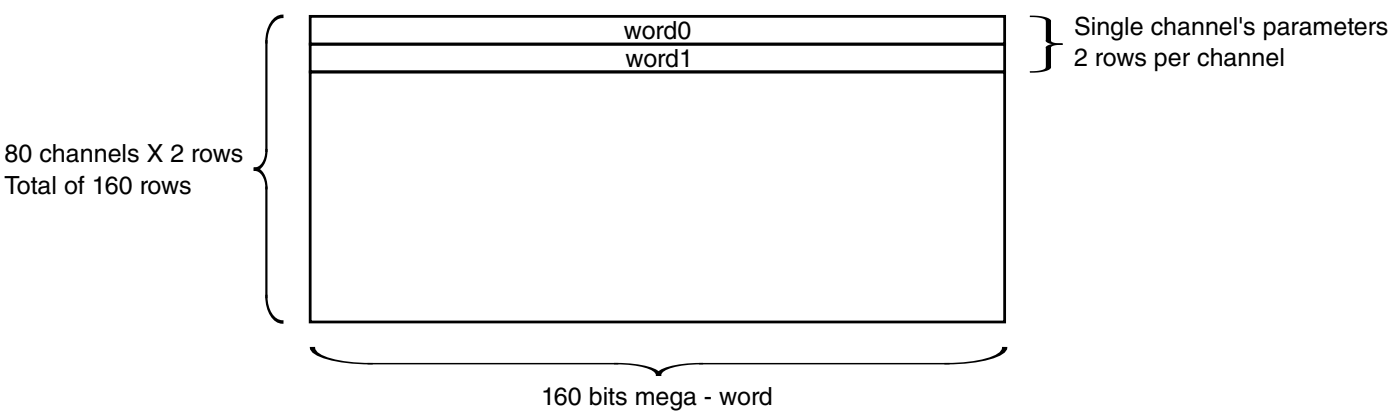

Figure 37-10. CPMEM structure

Each IDMAC channel can be configured to work in one of two different modes:

- Non Interleaved mode where the Y:U:V data is organized in 3 separate buffers in the system's memory
- Interleaved mode where the Y:U:V data is organized in a single buffer in the system's memory

The parameters and the way they are organized are different for each mode. The Pixel Format Select (PFS) value of the CPMEM words are used by the IPU to determine if the words should be interpreted as interleaved or non-interleaved format.

NOTE

CPMEM is "Memory Mapped" and can be accessed by the AHB bus through the Control Module (see Memory Access Unit).

The following tables describe the IDMAC parameters and their organization in each mode.

37.4.2.10.1 CPMEM's words' structure for non interleaved mode

The table below describes the CPMEM's words' structure for non interleaved mode. Each CPMEM word consist of 160 bits. The bits that are not listed in the table below are reserved bits.

Table 37-14. Channel Parameters Memory for non-interleaved

Name	Mnemonic	Size	Location	Description
Word 0				
XV Virtual Coordinate	XV	10 bits	W0[9:0]	Variable coordinates for determining next block address. {X1,Y1} and {X2,Y2} coordinates will be determined according to {XV,YV} upon restart of channel. These coordinates are used for Y:U:V (Y pointer) and RGB formats.
YV Virtual Coordinate	YV	9 bits	W0[18:10]	
XB inner Block Coordinate	XB	13 bits	W0[31:19]	Variable coordinates for determining address within the block. These coordinates are used for Y:U:V (Y pointer) and RGB formats. Need 24 bits for 2D transfer support.
YB inner Block Coordinate	YB	12 bits	W0[43:32]	
New Sub Block	NSB_B	1 bit	W0[44]	This bit determines if the next value for {XB,YB} should be taken from {XB,YB} saved in channel parameter memory or from new {x1,y1}/{x2,y2}.
Current Field	CF	1 bit	W0[45]	CF = 0 Current field is even CF = 1 Current field is odd
Mem U Buffer Offset	UBO	22 bits	W0[67:46]	Double buffer destination address offset for Y:U:V (U pointer) formats.The actual physical address value is divided by 8 (i.e. this parameter includes bits [24:3] of the actual address)

Table continues on the next page...

Table 37-14. Channel Parameters Memory for non-interleaved (continued)

Mem V Buffer Offset	VBO	22 bits	W0[89:68]	Double buffer destination address offset for Y:U:V (V pointer) format. The actual physical address value is divided by 8 (i.e. this parameter includes bits [24:3] of the actual address)
Initial Offset X	IOX	4 bits	W0[93:90]	The IOX parameter, is the offset in pixels for a frame that starts at a non aligned address. for 42x formats must be even.
Reduce Double Read or Writes	RDRW	1 bits	W0[94:94]	This bit is relevant for YUV4:2:0 formats. For read channels: U and V components are not read from odd rows. (read - supported only for the VDIC) For write channels: U and V components are not written to odd rows. (write - supported for all write channels)
Scan Order	SO	1 bit	W0[113]	SO = 0 Scan order is progressive SO = 1 Scan order is interlaced
Band Mode	BNDM	3 bits	W0[116:114]	BNDM = 000 bands disable. BNDM = 001 bands enable. Band height = 4 lines. BNDM = 010 bands enable. Band height = 8 lines. BNDM = 011 bands enable. Band height = 16 lines. BNDM = 100 bands enable. Band height = 32 lines. BNDM = 101 bands enable. Band height = 64 lines. BNDM = 110 bands enable. Band height = 128 lines. BNDM = 111 bands enable. Band height = 256 When working in band mode, the channel's corresponding IDMAC_BNDM_EN bit has to be set.
Block Mode	BM	2 bits	W0[118:117]	BM = 00 block mode disable. BW = FW, BH = FH BM = 01 block mode enable. BW = 8, BH = 8 BM = 10 block mode enable. BW = 16, BH = 16 (this mode is reserved for future use) BM = 11 not used
Rotation	ROT	1 bit	W0[119]	ROT = 0 -> No rotation ROT = 1 -> 90 degree rotation clockwise
Horizontal Flip	HF	1 bit	W0[120]	HF = 0 -> No flip HF = 1 -> Horizontal flip enable
Vertical Flip	VF	1 bit	W0[121]	VF = 0 -> No flip VF = 1 -> Vertical flip enable

Table continues on the next page...

Table 37-14. Channel Parameters Memory for non-interleaved (continued)

Threshold Enable	THE	1 bit	W0[122]	THE = 0 -> Threshold disable THE = 1 -> Threshold enable
Conditional Access Polarity	CAP	1 bit	W0[123]	CAP = 0 -> If conditional bit in CM register is low skip the access CAP = 1 -> If conditional bit in CM register is high skip the access. This mode is reserved for future use.
Conditional Access Enable	CAE	1 bit	W0[124]	CAE = 0 -> Conditional access disable CAE = 1 -> Conditional access enable This mode is reserved for future use.
Frame Width	FW	13 bits	W0[137:125]	Number of pixels in one row, of the channel frame. FW 000000000000 = 0001 pixels 000000000001 = 0002 pixels ..... 111111111111 = 8192 pixels
Frame Height	FH	12 bits	W0[149:138]	Number of pixels in one column, of the channel frame. FH 000000000000 = 0001 line 000000000001 = 0002 lines ..... 111111111111 = 4096 lines For progressive YUV 4:2:0 (non interleaved and partial interleaved formats) the FH value should be a multiple of 2. For interlaced YUV 4:2:0 (non interleaved and partial interleaved formats) the FH value should be a multiple of 4.
End of Line interrupt	EOLI	1 bit	W0[150]	End of line interrupt enable. The end of line indication is asserted once the last data of the line has been written. 1 - generate an end of line interrupt 0 - no affect
Word 1				
Ext Mem Buffer 0 Address	EBA0	29 bits	W1[28:0]	1st double buffer destination address for RGB and Y:U:V (Y pointer) formats. This parameter must not be changed if the corresponding channel is enabled. The actual physical address value is divided by 8 (i.e. this parameter includes bits [31:3] of the actual address)

Table continues on the next page...

Table 37-14. Channel Parameters Memory for non-interleaved (continued)

Ext Mem Buffer 1 Address	EBA1	29 bits	W1[57:29]	2nd double buffer destination address for RGB and Y:U:V (Y pointer) formats. This parameter must not be changed if the corresponding channel is enabled. The actual physical address value is divided by 8 (i.e. this parameter includes bits [31:3] of the actual address)
Interlace Offset	ILO	20 bits	W1[77:58]	2nd double buffer destination address for RGB and Y:U:V (Y pointer) formats. An interlaced data stored in the memory can be read as a consecutive progressive only if FW*BPP is a multiplication of 8. The actual physical address value is divided by 8 (i.e. this parameter includes bits [22:3] of the actual address). For YUV420 formats, the ILO is relevant only to the Y component as the U and V components do not exist for the even lines. This value is signed
Number of Pixels in Whole Burst Access	NPB	7 bits	W1[84:78]	Number of pixels per burst access. The following are valid numbers of pixels in a memory burst access according to the BPP parameter: NPB 0000111 = 08 pixels in each burst 0001111 = 16 pixels in each burst ..... 0111111 = 64 pixels in each burst Range: 16BPP => 1 -> 32 pixels (for YUV444 NI) 08BPP => 1 -> 64 pixels (For YUV420 NI/PI and YUV422 NI/PI) In NI/PI formats the NPB has to be a multiplication of 8
Pixel Format Select	PFS	4 bits	W1[88:85]	4'h0 = non-interleaved 4:4:4 4'h1 = non-interleaved 4:2:2 4'h2 = non-interleaved 4:2:0 4'h3 = partial interleaved 4:2:2 4'h4 = partial interleaved 4:2:0 4'h5 to 4'hF = NA
Alpha Used	ALU	1 bit	W1[89]	1 = the alpha associated with the data of this channel resides on another channel (separate buffer) 0 = the alpha associated with the data of this channel resides along with the pixel data (same buffer) The corresponding alpha channel must be enabled to assure correct behavior.

Table continues on the next page...

Table 37-14. Channel Parameters Memory for non-interleaved (continued)

Alpha Channel Mapping	ALBM	2 bits	W1[92:90]	Alpha channel mapping - This parameter is a pointer to a buffer in the ATC memory. This parameter is relevant only to data channels that are associated with a separate alpha buffer (like graphic plane channels). The parameter should be programmed on the data channels' ALBM. Setting this parameter to any other channel has no meaning. See Table 37-12 for exact ALBM mapping.
AXI Id	ID	2 bits	W1[94:93]	AXI protocol id
Threshold	TH	7 bits	W1[101:95]	0000000 = 32 lines 0000001 = 64 lines ..... 1111111 = 4096 lines
Stride Line	SLY	14 bits	W1[115:102]	Address vertical scaling factor in bytes for memory access. Also number of maximum bytes in the "Y" component row according to memory limitations. SLY 00000000000000 = 00001 bytes 00000000000001 = 00002 bytes ..... 11111111111111 = 16384 bytes
Width3	WID3	3 bits	W1[127:125]	Fourth color component size of the input-unpacking/ output-packing pixel. WID3 000 = 1 bits 001 = 2 bits ..... 111 = 8 bits As this is a non-interleaved format, this field is relevant only to the alpha associated with this pixel channel.
Stride Line	SLUV	14 bits	W1[141:128]	Address vertical scaling factor in bytes for memory access. Also number of maximum bytes in the "U" or "V" component row according to memory limitations. SLUV 00000000000000 = 00001 bytes 00000000000001 = 00002 bytes ..... 11111111111111 = 16384 bytes
Conditional Read Enable	CRE	1 bit	W1[149:149]	This bit enables the conditional read feature.

37.4.2.10.2 CPMEM's words' structure for interleaved mode

The table below describes the CPMEM's words' structure for interleaved mode. Each CPMEM word consist of 160 bits. The bits that are not listed in the table below are reserved bits

Table 37-15. Channel Parameters Memory for interleaved

Name	Mnemonic	Size	Location	Description
Word 0				
XV Virtual Coordinate	XV	10 bits	W0[9:0]	Variable coordinates for determining next block address. {X1,Y1} and {X2,Y2} coordinates will be determined according to {XV,YV} upon restart of channel. These coordinates are used for Y:U:V (Y pointer) and RGB formats.
YV Virtual Coordinate	YV	9 bits	W0[18:10]	
YB inner Block Coordinate	XB	13 bits	W0[31:19]	Variable coordinates for determining address within the block. These coordinates are used for Y:U:V (Y pointer) and RGB formats. Need 24 bits for 2D transfer support.
XB inner Block Coordinate	YB	12 bits	W0[43:32]	
New Sub Block	NSB_B	1 bit	W0[44]	This bit determines if the next value for {XB,YB} should be taken from {XB,YB} saved in channel parameter memory or from new {x1,y1}/{x2,y2}.
Current Field	CF	1 bit	W0[45]	CF = 0 Current field is even CF = 1 Current field is odd
Scroll X counter	SX	12 bits	W0[57:46]	Holds the temporary count for the Scroll X in between frame For interleaved YUV4:2:2 formats the SX should be a multiple of 2.
Scroll Y counter	SY	11 bits	W0[68:58]	Holds the temporary count for the Scroll Y in between frame
Number of Scroll	NS	10 bits	W0[78:69]	This variable holds the total number of Scrolls
Scroll Delta X	SDX	7 bits	W0[85:79]	Frame start row offset, compared to last frame. SDX 0000000 = 00 pixels 0000001 = 01 pixels 0000010 = 02 pixels ..... 1111110 = 126 pixels 1111111 = 127 pixels For interleaved YUV4:2:2 formats the SDX should be a multiple of 2.

Table continues on the next page...

Table 37-15. Channel Parameters Memory for interleaved (continued)

Scroll Max	SM	10 bits	W0[95:86]	Frame maximum row and column increment offset in frame. SM 0000000000 = 0001 0000000001 = 0002 ..... 1111111111 = 1024
Scrolling Configuration	SCC	1 bit	W0[96]	Determines if scrolling will continue from zero when NS counter has reached SM or stop at the current value for SX and SY for the next frames to come. SCC 0 => Scrolling will stop at NS = SM 1 => Scrolling will start from "0" at NS = SM
Scrolling Enable	SCE	1 bit	W0[97]	SCE = 0 Scrolling disable SCE = 1 Scrolling enable
Scroll Delta Y	SDY	7 bits	W0[104:98]	Frame start column offset, compared to last frame. SDY 0000000 = 00 pixels 0000001 = 01 pixels 0000010 = 02 pixels ..... 1111110 = 30 pixels 1111111 = 127 pixels
Scroll Horizontal Direction	SDRX	1 bit	W0[105]	Determines if the next frame will move right or left compared to the current frame. SDRX 0 => Next frame will be right of current 1 => Next frame will be left of current
Scroll Vertical Direction	SDRY	1 bit	W0[106]	Determines if the next frame will move down or up compared to the current frame. SDRY 0 => Next frame will be down of current 1 => Next frame will be up of current
Bits Per Pixel	BPP	3 bits	W0[109:107]	3'h0 = 32 Bits per pixel 3'h1 = 24 Bits per pixel 3'h2 = 18 Bits per pixel

Table continues on the next page...

Table 37-15. Channel Parameters Memory for interleaved (continued)

				3'h3 = 16 Bits per pixel 3'h4 = 12 Bits per pixel 3'h5 = 08 Bits per pixel 3'h6 = 04 Bits per pixel
Decode Address Select	DEC_SEL	2 bits	W0[111:110]	Upon 4BPP, selects between two look-up tables DEC_SEL 00 = addresses 0 to 15 01 = addresses 64 to 79 10 = addresses 128 to 143 11 = addresses 192 to 207
Access Dimension	DIM	1 bit	W0[112]	DIM = 0 Access Dimension is 2d DIM = 1 Access Dimension is 1d
Scan Order	SO	1 bit	W0[113]	SO = 0 Scan order is progressive SO = 1 Scan order is interlaced
Band Mode	BNDM	3 bits	W0[116:114]	BNDM = 000 bands disable. BNDM = 001 bands enable. Band height = 4 lines. BNDM = 010 bands enable. Band height = 8 lines. BNDM = 011 bands enable. Band height = 16 lines. BNDM = 100 bands enable. Band height = 32 lines. BNDM = 101 bands enable. Band height = 64 lines. BNDM = 110 bands enable. Band height = 128 lines. BNDM = 111 bands enable. Band height = 256 When working in band mode, the channel's corresponding IDMAC_BNDM_EN bit has to be set.
Block Mode	BM	2 bits	W0[118:117]	BM = 00 block mode disable. BW = FW, BH = FH BM = 01 block mode enable. BW = 8, BH = 8 BM = 10 block mode enable. BW = 16, BH = 16 (this mode is reserved for future use) BM = 11 not used
Rotation	ROT	1 bit	W0[119]	ROT = 0 -> No rotation ROT = 1 -> 90 degree rotation clockwise

Table continues on the next page...

Table 37-15. Channel Parameters Memory for interleaved (continued)

Horizontal Flip	HF	1 bit	W0[120]	HF = 0 -> No flip HF = 1 -> Horizontal flip enable

Table 37-15. Channel Parameters Memory for interleaved (continued)

				This field is relevant only for interleaved RGB format (PFS = 4'h7)
Offset3	OFS3	5 bits	W1[147:143]	Number of bits between MSB of pixel and MSB of color component on input. 4 states that the color component will be the fourth color component aligned to MSB output pixel. OFS3 00000 = No offset 00001 = u => 1 bit sleft, p => 1 bit sright ..... 11111 = u => 31 bit sleft, p => 31 bit sright * u = unpacking * p = packing * sleft = shift left * sright = shift right This field is relevant only for interleaved RGB format (PFS = 4'h7)
Select SX SY Set	SXYS	1 bit	W1[148:148]	This bit selects between the settings on: SC_CORD and SC_CORD1
Conditional Read Enable	CRE	1 bit	W1[149:149]	This bit enables the conditional read feature.
Decode Address Select bit[2]	DEC_SEL2	1 bit	W1[150:150]	This field is reserved

1. Y1U1Y2V1 means byte0 = bits [7:0] =Y1; byte1 = bits [15:8] =U1; byte2 = bits [23:16] =Y2; byte3 = bits [31:24] = V1
2. Y2U1Y1V1 means byte0 =Y2; byte1 =U1; byte2 =Y1; byte3 = V1
3. U1Y1V1Y2 means byte0 =U1; byte1 =Y1; byte2 =V1; byte3 = Y2
4. U1Y2V1Y1 means byte0 =U1; byte1 =Y2; byte2 =V1;byte3 = Y1

37.4.2.10.3 Accessing the CPMEM for programming

Each IDMAC's channel's parameters are located on 2 CPMEM entries. Each Entry is 160 bit. The CPMEM is memory mapped and is accessible via the AHB bus. The AHB bus's accesses are 32bit wide. A CPMEM entry is composed of 5x32bit words. The next CPMEM entry starts at the next 8x32bit words (0x0, 0x20,0x40, etc.).

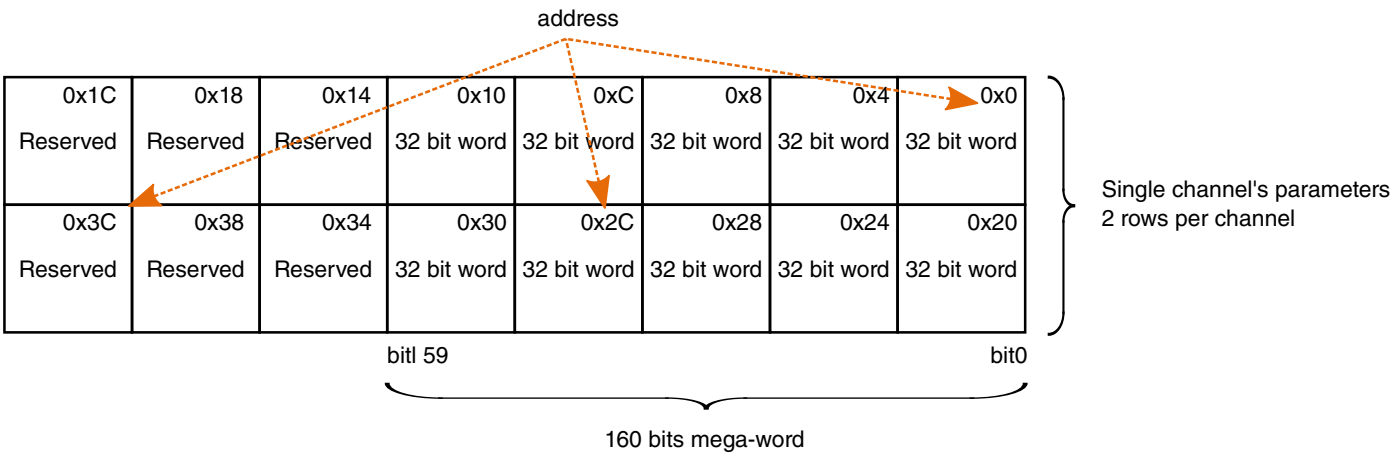

Figure 37-11. CPMEM's word structure

37.4.2.10.4 Alternate IDMAC settings

Some of the IDMAC channels support alternate flow. This means that a physical IDMAC channel can use alternate set of parameters. Switching between the flows is controlled by the CM.

The primary flow the IDMAC's settings are read from the channel's corresponding entry in the CPMEM. The alternate settings can be stored in another entry on the CPMEM. The pointer to the alternate entry on the CPMEM is stored on the physical channel's corresponding IDMAC_SUB_ADDR parameters.

37.4.2.11 IDMAC's modes of operation

37.4.2.11.1 Rotation modes

Rotation is performed by the IDMAC and the Rotation unit inside the IC.

The frame is partitioned into 8X8 pixels blocks. The IC reorders the pixels within a block. The IDMAC reorders the block. The reordering is done according to the ROT, VF & HF parameters in the CPMEM.

The following diagram illustrate various options for reordering of blocks.

- ROTATE means that the ROT bit is set
- HORIZONTAL means that the HF bit is set
- VERTICAL means that the VF bit is set

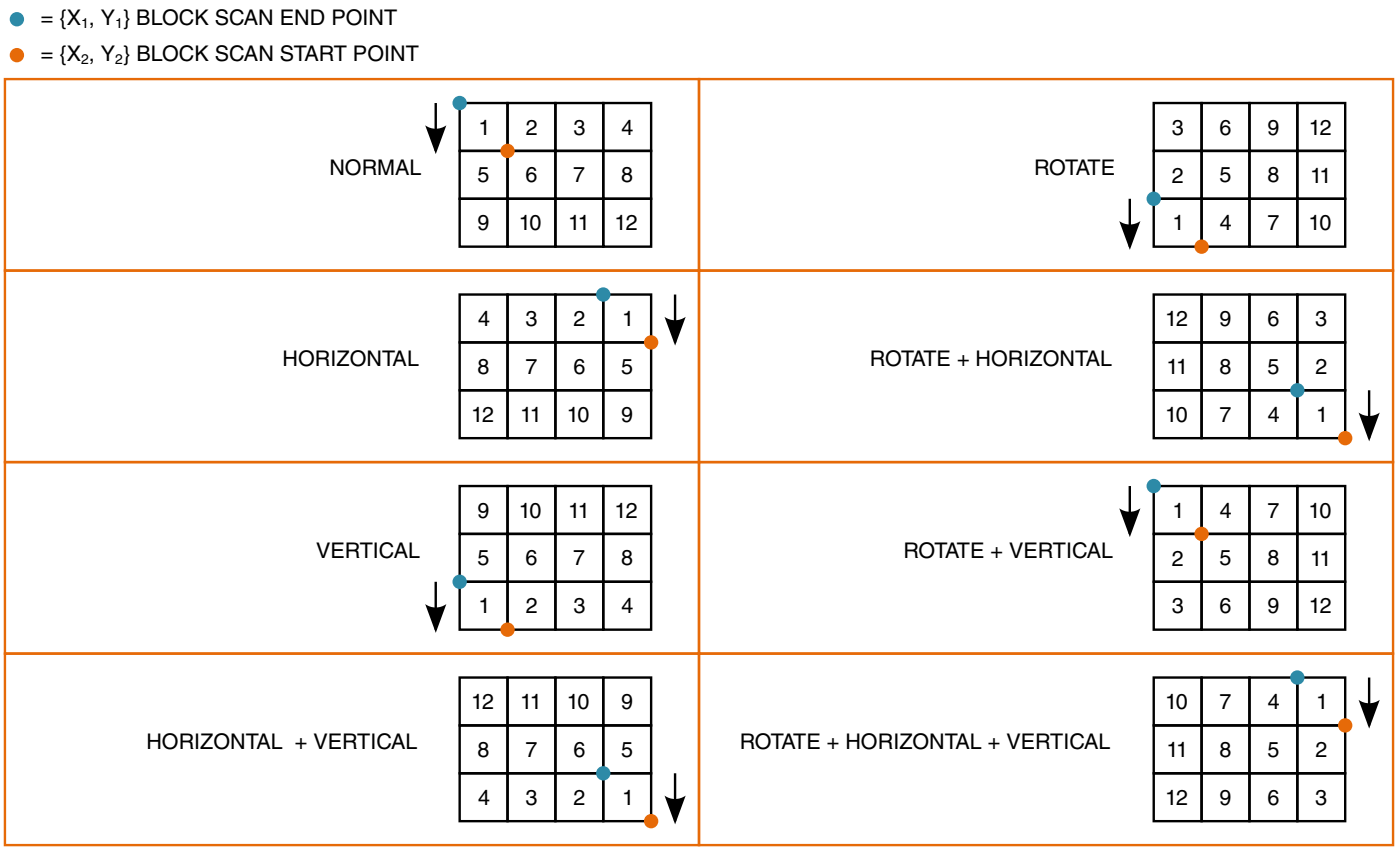

Figure 37-12. Rotation options

37.4.2.11.2 Frame size

The IPU supports various non-interleaved modes; the Frame Height (FH) and Frame Width (FW).

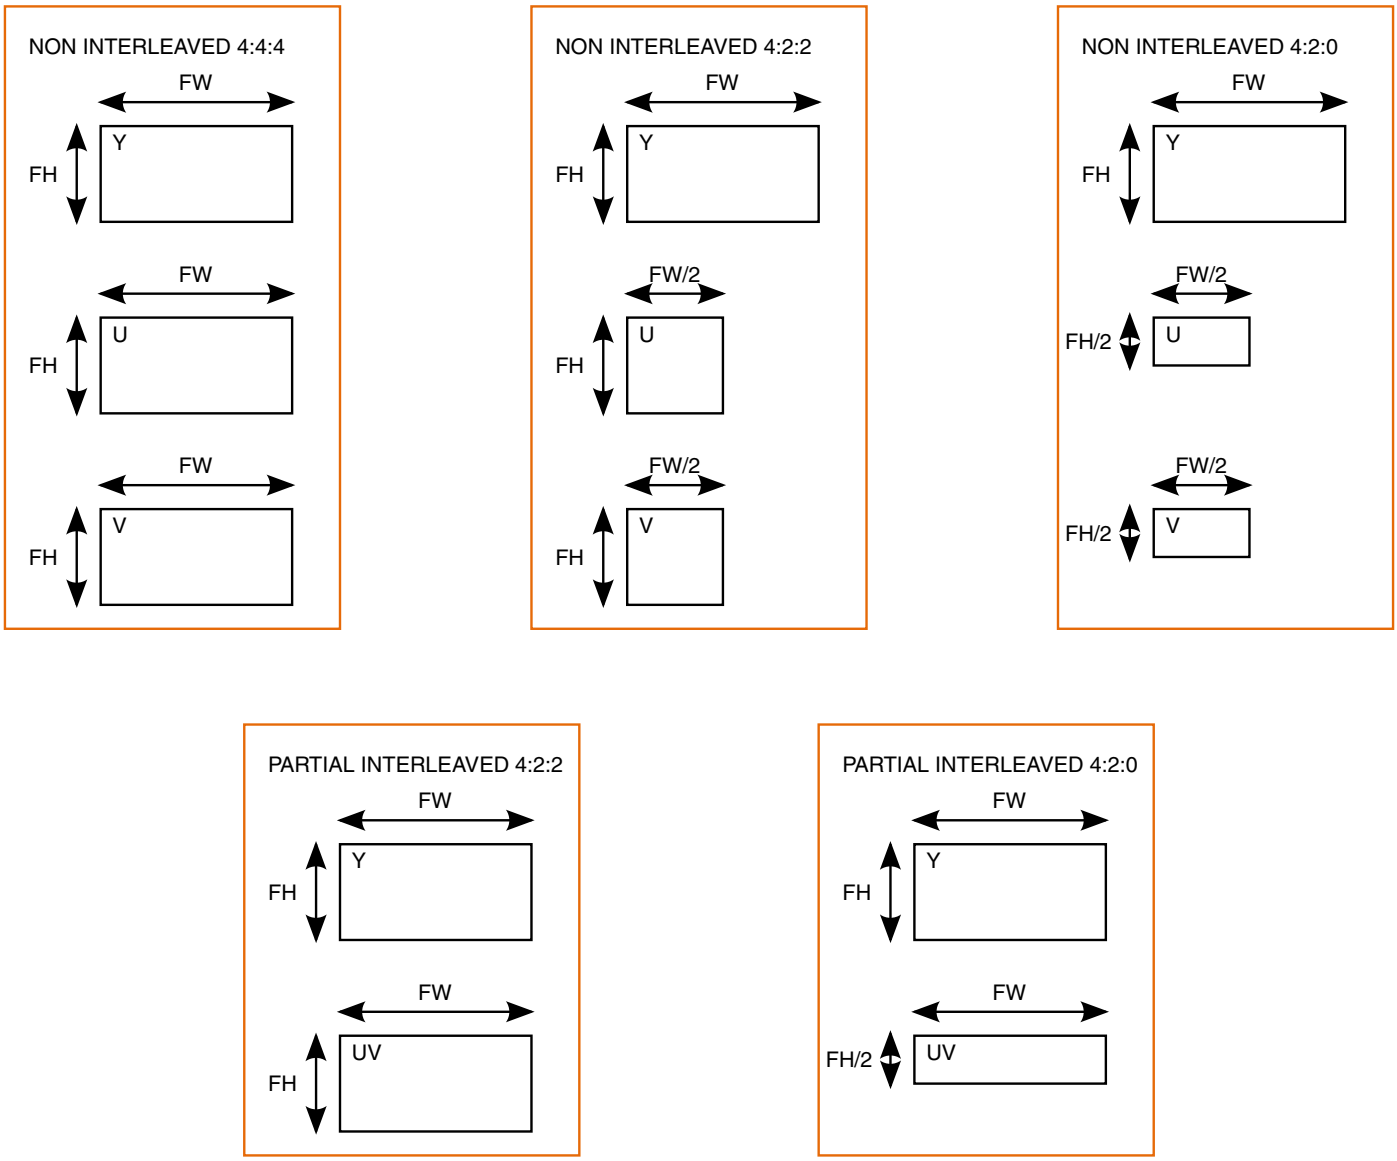

Figure 37-13. Frame size in various modes

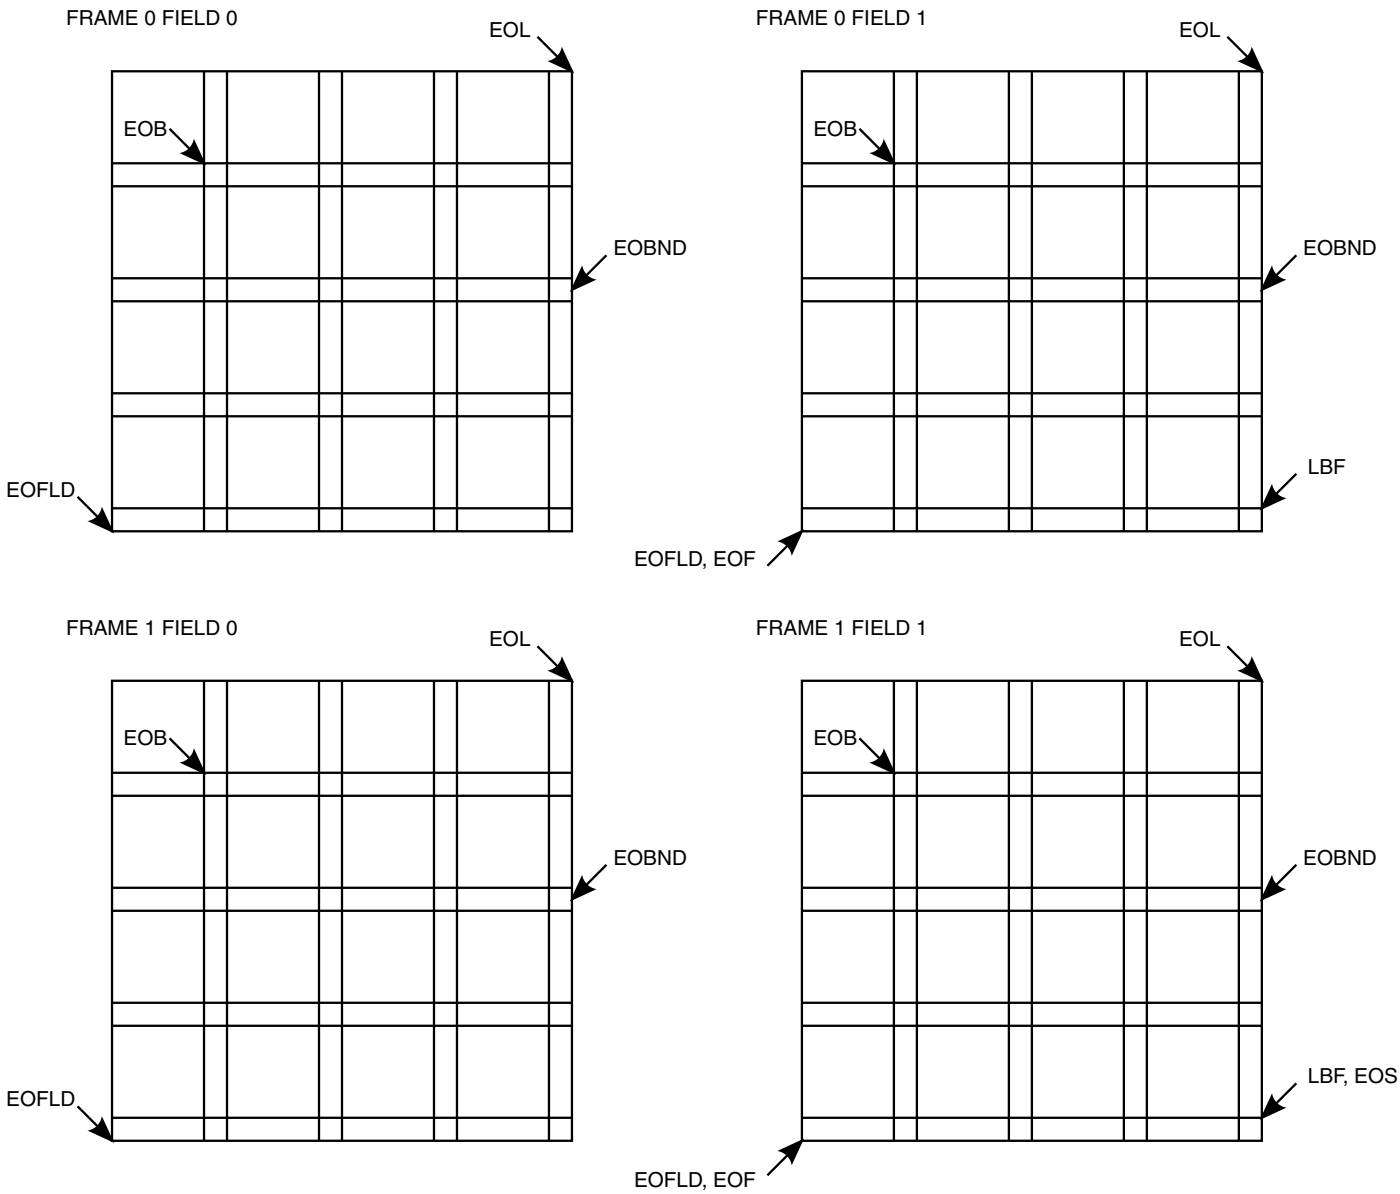

Figure 37-14. Frame's controls

37.4.2.12 IDMAC's restriction

The data must be received from the system's memory through the AXIR interface ("read" direction) "in-order" within a single burst. The entire burst can occur "out-of-order."

37.4.2.13 IDMAC's Endianness support

Byte Endianness - only LE (little endian) is supported

Pixel Endianness - both LE & BE are supported, only for read direction (only 4 BPP case is meaningful, supported only for the "read" direction)

37.4.2.14 IDMAC's internal events

Some of the IDMAC's internal signals can be used for monitor the progress of flows. These bits can be polled by software. Some of these bits can be used to trigger an interrupt or an SDMA event.

The following table describes the available events and their meaning

Table 37-16. IDMAC's internal events

IDMAC event's type	Monitored on	Event's meaning
end of frame	IDMAC_EOF	This is the channel's end of frame indication. This indication is asserted once the entire frame was read/written via the IDMAC. This indication is normally used as an interrupt or SDMA event
new frame acknowledge	IDMAC_NFACK	This indication means that the IDMAC acknowledge the new frame's request from the module. It can be used to track the starting point of a flow or a frame.
new frame before end of frame error	IDMAC_NFB4EOF_ERR	This error indication may indicate on data lost. This indication is asserted when a new frame starts before the completion of the previous frame. For example if a real time input (from camera) was not written properly to the memory due to FIFO full condition.
end of scroll	IDMAC_EOS	end of scroll; This indication is asserted when the scroll counter finished counting its pre defined value
end of band	IDMAC_EOBND	This is the end of band indication. Any time IDMAC complete reading/writing a band it will assert this indication. This is useful to manually control a flow via channels working in band mode.
treshold	IDMAC_TH	Threshold crossing indication. The treshold is defined according to the TH parameter in the IDMAC.
channel busy	IDMAC_CH_BUSY	This signal is asserted when a channel is between NFACK event to EOF event. Negation of these indications is one of the conditions for low power modes handshake.

37.4.3 Camera Sensor Interface (CSI)

The IPU has 2 identical camera sensor interfaces (CSI). The CSI description below refers to a single CSI.

37.4.3.1 CSI Block Diagram

The CSI consists of synchronizer, interface logic, Data packing unit and Sensor Interface Control.

The CSI is controlled via the peripheral bus registers. All programming parameters for the CSI are double buffered with synchronous change at the frame start.

The CSI gets data from the sensor, synchronizes the data and the control signals to the IPU clock (HSP_CLK), and transfer it according to configuration of DATA_DEST register to one or more of the following: IC, SMFC.

This figure shows the CSI Block Diagram.

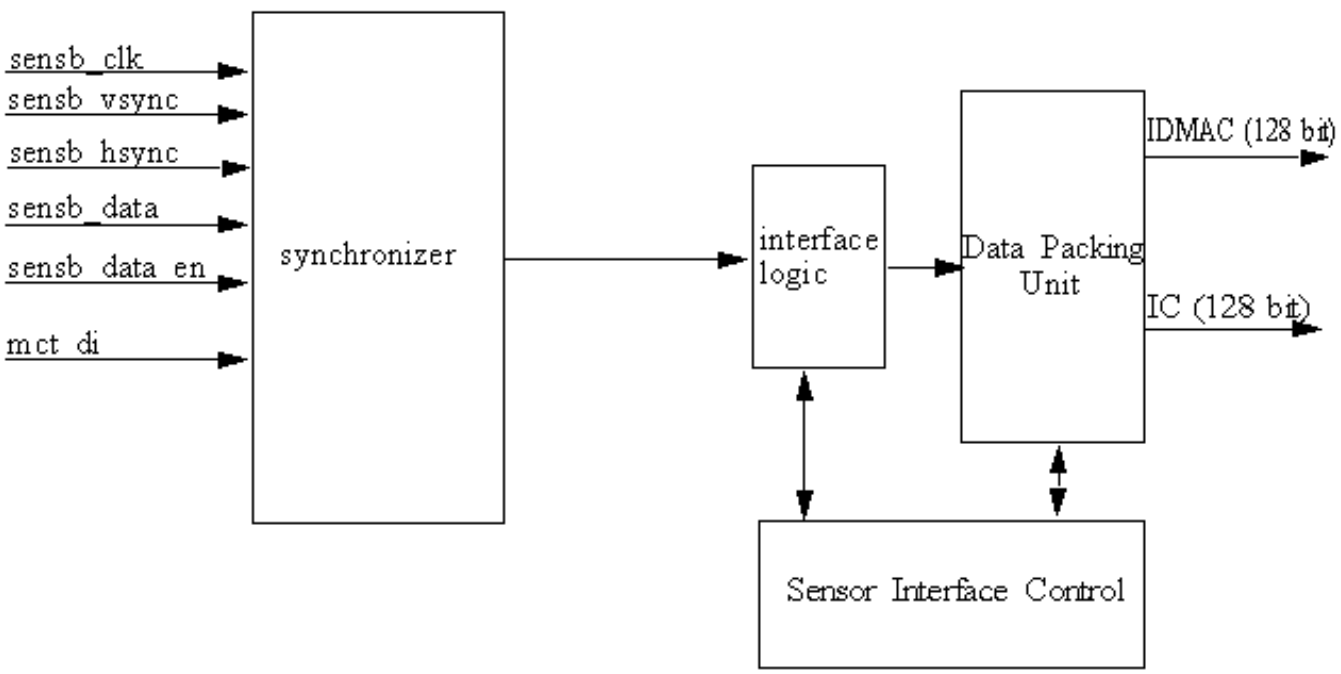

Figure 37-15. CSI Block Diagram

37.4.3.2 CSI Interface

CSI supports two types of interfaces. The interface is determined via the DATA_SOURCE register.

37.4.3.2.1 Parallel Interface

In parallel interface a single value arrives in each clock, except when working in BT.1120 mode, in which two values arrive in each cycle. Each value can be 8-16 bit wide according to configuration of DATA_WIDTH. If DATA_WIDTH is configured to N, then 20-N LSB bits are ignored.

CSI can work with several data formats according to SENS_DATA_FORMAT configuration. In case the data format is YUV, the output of the CSI is always YUV444 (even if the data arrives in YUV422 format).

The polarity of the inputs can be configured using the registers SENS_PIX_CLK_POL, DATA_POL, HSYNC_POL and VSYNC_POL.

37.4.3.2.2 High-speed serial interface - MIPI (Mobile Industry Processor Interface).

In MIPI interface two values arrive in each cycle. Each value is 8 bit wide, which means 16 MSB bits of the data bus input are treated, while 4 LSB bits are ignored.

When working in this mode, the CSI can handle up to 4 streams of data. Each stream is identified with DI (data identifier) that includes the virtual channel and the data type of this stream. Each stream that is handled is defined in registers MIPI_DI0-3. Only the main stream (MIPI_DI0) can be sent to all destination units while the other streams are sent only to the SMFC as generic data.

In this mode SENS_DATA_FORMAT and DATA_WIDTH registers are ignored, since this information is coming to the CSI via the MCT_DI bus.

37.4.3.3 Test Mode

When TEST_GEN_MODE register is configured to 1, the TEST MODE which is a debugging mode, is operated.

The CSI generates the frame by itself and sends it to one of the destination units. The sent frame is a chess board composed of black and configured color squares. The configured color is set with the registers PG_B_VALUE, PG_G_VALUE and PG_R_VALUE. The data can be sent in different frequencies according to the configuration of DIV_RATIO register.

CSI Test Mode requires the following CSIx_SENS_CONF settings:

CSIx_EXT_VSYNC = 0x1 (External VSYNC mode)

CSIx_DATA_WIDTH = 0x1 (8 bits per color)

CSIx_SENS_DATA_FORMAT = 0x0 (Full RGB or YUV444)

CSIx_PACK_TIGHT = 0x0

CSIx_SENS_PRTCL = 0x1 (Non-gated clock sensor timing/data mode)

CSIx_SENS_PIX_CLK_POL = 0x1 Pixel clock is inverted before applied to internal circuitry

CSIx_DATA_POL = 0x0 (Data lines are directly applied to internal circuitry.)

CSIx_HSYNC_POL = 0x0 (HSYNC is directly applied to internal circuitry)

CSIx_VSYNC_POL = 0x0 (VSYNC is directly applied to internal circuitry)

37.4.3.4 Sensor Image Frame Relations

The figure found here illustrates the generalized relations between image frames produced by a sensor and accepted by the CSI.

Generally, four frame definitions exist. The virtual frame A starts with the VSYNC signal. After vertical blanking starts frame B. The HSYNC signal indicates boundaries of the frame B. The frame B includes both the active sensor frame C and horizontal blanking intervals. A size of the blanking intervals depends on sensor type and programming. The size of the frame sent by the sensor (the actual pixels) has to be configured in the registers SENS_FRM_WIDTH and SENS_FRM_HEIGHT. The CSI selects a window (the frame D) inside the frame C by skipping rows and columns according to parameters defined in registers HSC, VSC, ACT_FRM_HEIGHT and ACT_FRM_WIDTH. frame D is sent to the rest of the IPU.

NOTE

The following limitation must exist:

SENS_FRM_HEIGHT >= VSC + ACT_FRM_HEIGHT

SENS_FRM_WIDTH >= HSC + ACT_FRM_WIDTH

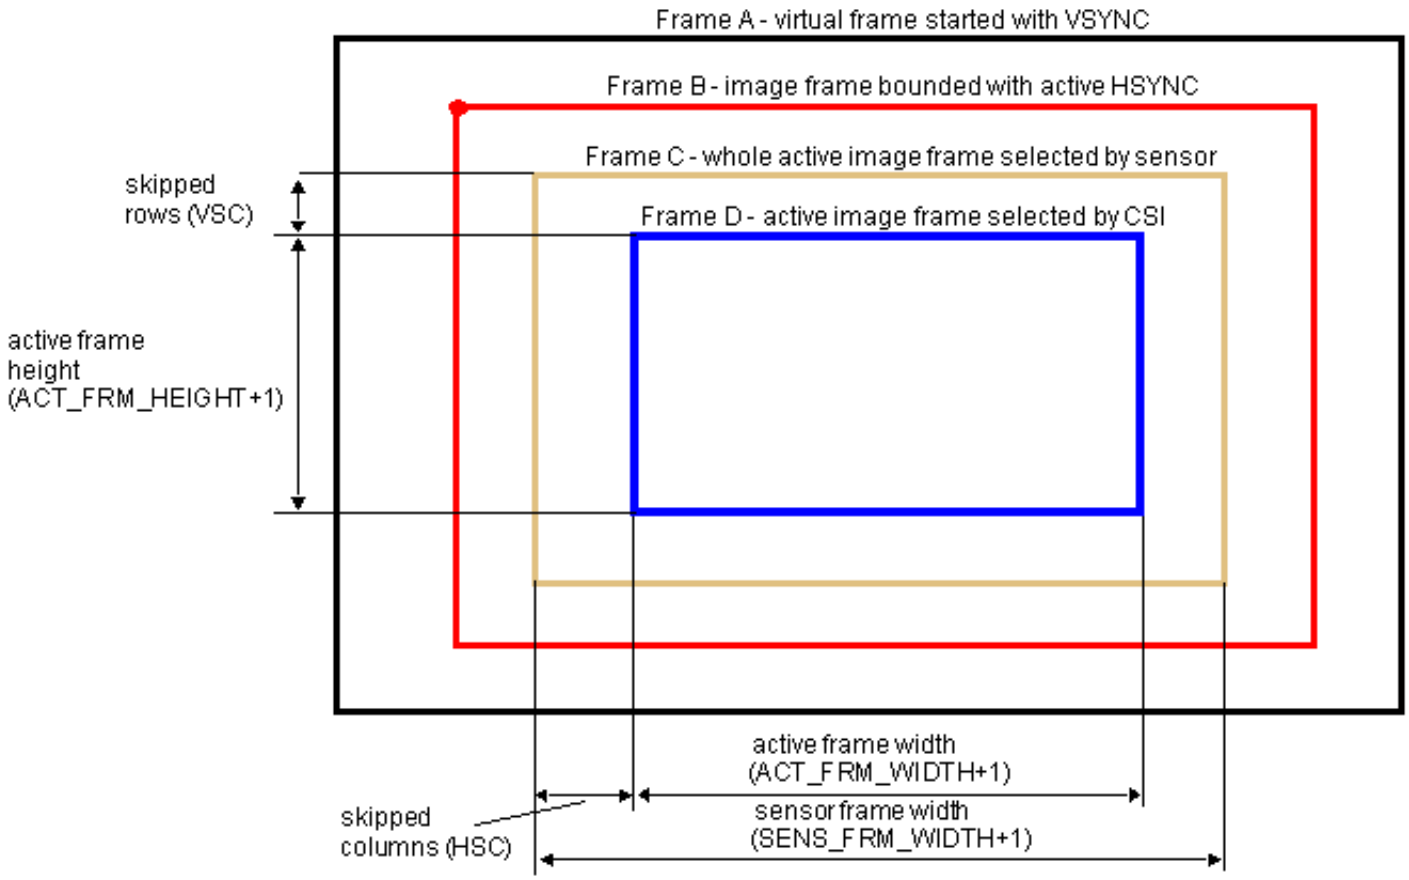

Figure 37-16. Sensor Image Frames

37.4.3.5 Companding

Companding is performed as follows:

input: 10-bit unsigned number.In case that component's size is bigger than 10 bit, 10 MSB bits are taken. In case that component's size is less than 10 bit, color extraction is performed.

First step: shift:

x-> clip(x + offset, 0, 1023)

where the offset is a 10 bit signed number that is configured in CPD_OFFSET1 and CPD_OFFSET2 registers.

second step - piecewise-linear map:

y = Min[255, (y1[k]+(((x-x1[k])*slope[k])>>6 + 1))>>1]

where:

- the input range 0..1023 is partitioned to 16 equal segments: x1[k] .. x1[k+1] - 1 where x1[k] = 0, 64, 128, 192, 256, .. . 960.

- The linear map, in each segment, is characterized by y1[k] (9-bit unsigned number) and slope[k] (8-bit unsigned number).

Each destination unit can get the data after being companded depending on the configuration of CPD register. If this register is configured to 3'h0, the compander units are disable in order to save power. Parameters of the companding are equal for all destinations and can be set in the CPD registers.

2 companding units are located in the CSI. This is because when working in MIPI orBT. 1120 modes 2 components arrive in each cycle and the companding for each 2 components has to be in parallel. When CSI works in other mode, only one compander is needed, so the other one is disabled to save power.

37.4.3.6 Timing/Data mode protocols

CSI can work in several timing/data mode protocols, according to SENS_PRTCL configuration.

37.4.3.6.1 Gated Mode

In this mode, VSYNC is asserted at the beginning frame. HSYNC is asserted at the beginning of a row and remains asserted until the end of the row. The sensor clock is ticking all the time.

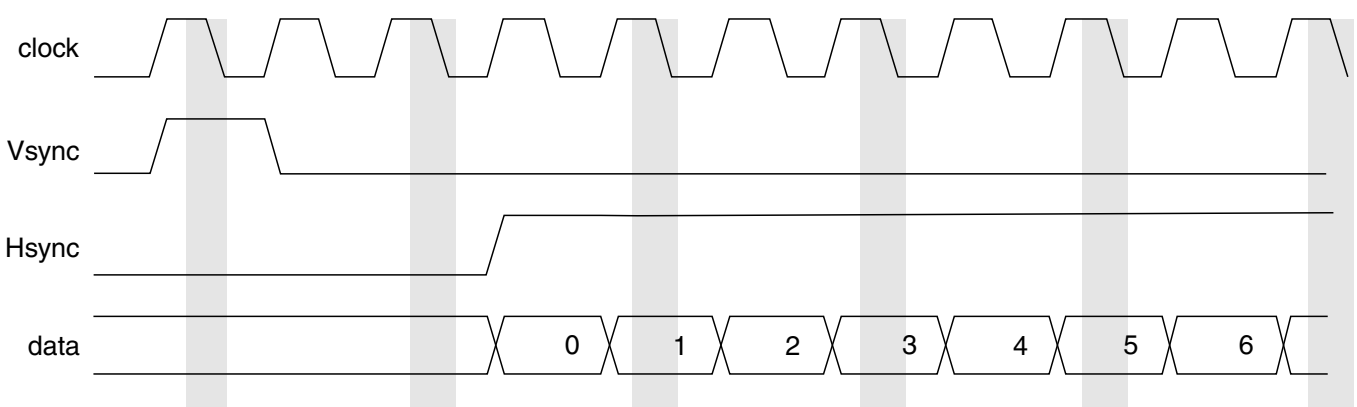

Figure 37-17. gated mode

37.4.3.6.2 Non-Gated Mode

In this mode VSYNC is used to indicate beginning of a frame. Sensor clock is ticking only when data is valid. HSYNC is not used.

When working with MIPI, the non-gated mode should be configured.

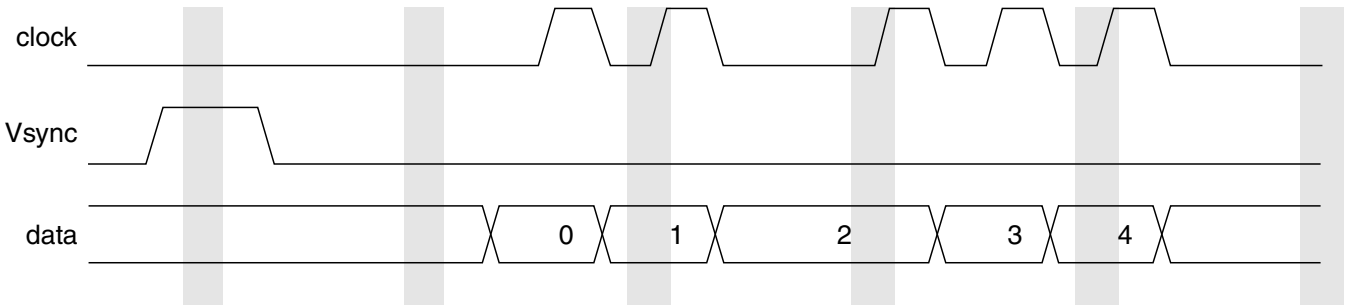

Figure 37-18. non-gated mode

37.4.3.6.3 BT.656 mode

In this mode the CSI works in compliance with recommendation ITU-R BT.656. The timing reference signals (frame start, frame end, line start, line end) are embedded in the data bus input. Each timing reference signal consists of a four word sequence. The first three words are fixed and configured in the CCIR_PRECOM register. The fourth word contains information defining field, the state of field blanking and the state of line blanking. these states are configured in registers CCIR_CODE_1 (for field 0) and CCIR_CODE_2 (for field 1).

In this mode in each cycle one value of data arrives

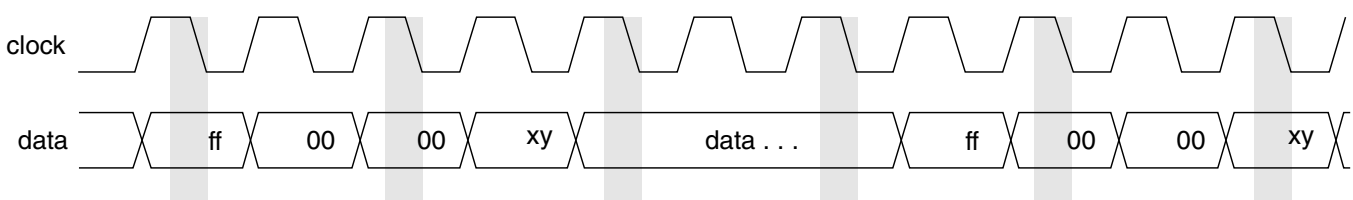

Figure 37-19. BT.656 mode

In this diagram the first three words are 0xff, 0x00, 0x00. The fourth word is XY and it includes the timing reference.

37.4.3.6.4 BT.1120 mode

In this mode the CSI works in compliance with recommendation ITU-R BT.1120. The timing reference signals (frame start, frame end, line start, line end) are embedded in the data bus input. Each timing reference signal consists of a four word sequence. The first three words are fixed and configured in the CCIR_PRECOM register. The fourth word contains information defining field, the state of field blanking and the state of line blanking. these states are configured in registers CCIR_CODE_1 (for field 0) and CCIR_CODE_2 (for field 1).

In this mode, the CSI can also work in DDR mode - data arrives on every edge of the clock. In addition, in each cycle two value of data arrive.

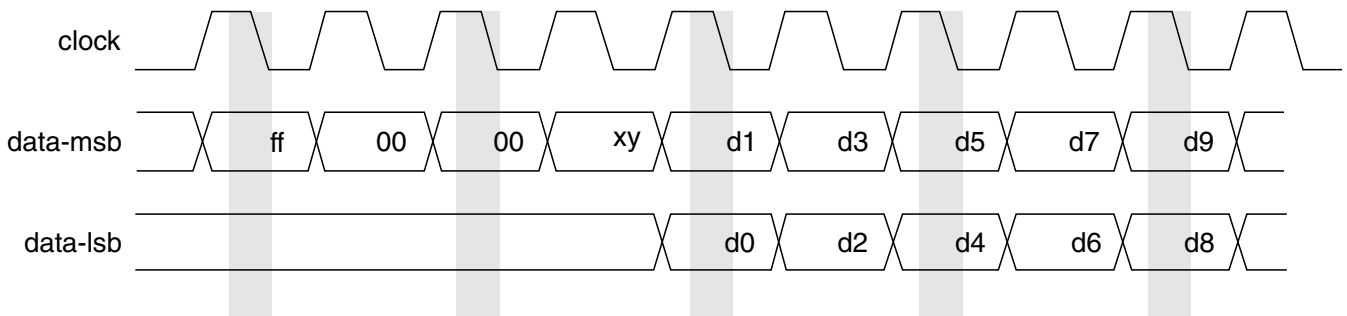

Figure 37-20. BT.1120 mode - SDR mode

In the above diagram each data arrives with the positive edge of the clock.

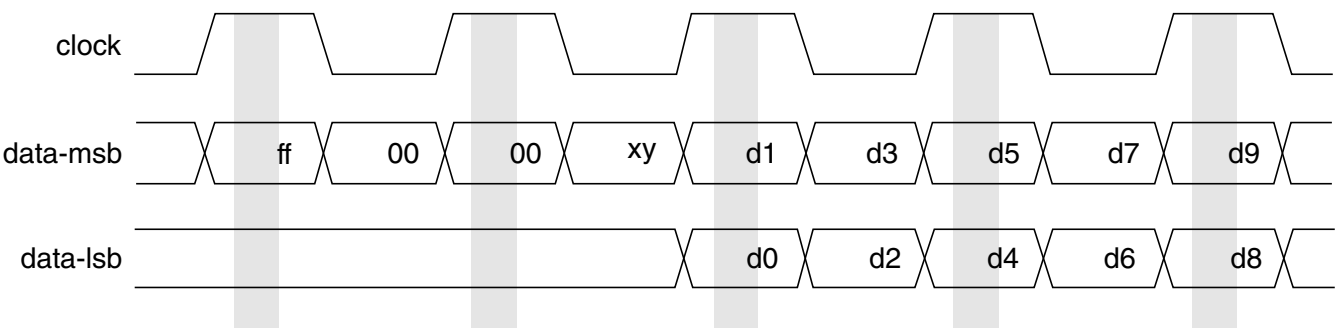

Figure 37-21. BT.1120 mode - DDR mode

In the above diagram, data arrives in the positive edge and the negative edge of the clock.

37.4.3.7 Packing to memory

The data bus output to the SMFC is 128-bit.

The following table shows the how the CSI performs the packing before sending the data to the SMFC.

The data bus output to the SMFC is 128-bit. The following table shows the how the CSI performs the packing before sending the data to the SMFC.

Table 37-17. Packing Unit

data format	component size	companded	regular packing	tight packing
Bayer, Generic data, JPEG	8	{8DC[1] ,8DC,8DC,...,8DC}	{8D,8D,8D,...,8D[2] }	NA
	9-16	{8DC,8DC,8DC,...,8DC}	{16DE[3] ,16DE,...,16DE}	NA
RGB, YUV	8	{8DC,8DC,8DC,8R}	{8D,8D,8D,8R}	NA
	9-10	{8DC,8DC,8DC,8R}	{16DE,16DE,16DE,16R[4] }	{10DE,10DE,10DE,2R}
	11-16	{8DC,8DC,8DC,8R}	{16DE,16DE,16DE,16R}	{10DT[5] ,10DT,10DT,2R}

1. DC - data after being companded
2. D - data arrived from sensor.
3. DE - data after being extended.
4. R- reserved bits
5. DT - data after being truncated.

The tight packing functionality is enabled when PACK_TIGHT register is set. It is only used when data format is RGB or YUV and the data width is bigger than 8.

37.4.3.8 Skipping frames

Some of the frames that are sent to the SMFC can be skipped. Skipped frames are ignore by the CSI and are not sent to the corresponding unit.

Using SKIP_SMFC and MAX_RATIO_SKIP_SMFC registers the user can define the frames for the SMFC that will be skipped.

37.4.3.9 16 bit camera support

Devices that support 16 bit data bus can be connected to the CSI. This can be done in one of the following ways.

16 bit YUV422

In this mode the CSI receives 2 components per cycle. The CSI is programmed to accept the data as 16 bit generic data. The captured data will be stored in the memory through the SMFC. The IDMAC needs to be programmed to store 16bit generic data. When the data is read back from the memory for further processing in the IPU it will be read as YUV422 data.

16 bit RGB as generic data

In this mode the CSI receives 3 components per cycle. If the external device is 24bit - the user can get connect a 16 bit sample of it (such as RGB565) The CSI is programmed to accept the data as 16 bit generic data. The captured data will be stored in the memory through the SMFC. The IDMAC needs to be programmed to store 16bit generic data. When the data is read back from the memory for further processing in the IPU it will be read as 16 bit RGB data. The IDMAC's mapping unit will be used to remap the 16 bit data to the internal 24bpp RGB format In this mode on the fly processing is can't be performed. The data has to be sent to the memory first and then further processed by the IPU.

16 bit RGB565

This is the only mode that allows on the fly processing of 16 bit data. In this mode the CSI is programmed to receive 16 bit generic data. In this mode the interface is restricted to be in "non-gated mode" and the CSI#_DATA_SOURCE bit has to be set If the external device is 24bit - the user can connect a 16 bit sample of it (RGB565 format). The IPU has to be configured in the same way as the case of CSI#_SENS_DATA_FORMAT=RGB565

37.4.3.10 CSI Restrictions

The frequency of the sensor clock must not be greater than the IPU clock (HSP_CLK)

SENS_FRM_HEIGHT >= VSC + ACT_FRM_HEIGHT

SENS_FRM_WIDTH >= HSC + ACT_FRM_WIDTH

37.4.4 Sensor Multi FIFO Controller (SMFC)

The Sensor Multifile Controller used as buffer between CSI and IDMAC. Two masters (CSIs) can be connected to SMFC. Both masters can be active simultaneously.

Each master can send up to 4 frames, distinguished by csi_id bus. The frame can be mapped to one of four IDMAC channels via SMFC mapping registers. Each DMA channel have dedicated FIFO.

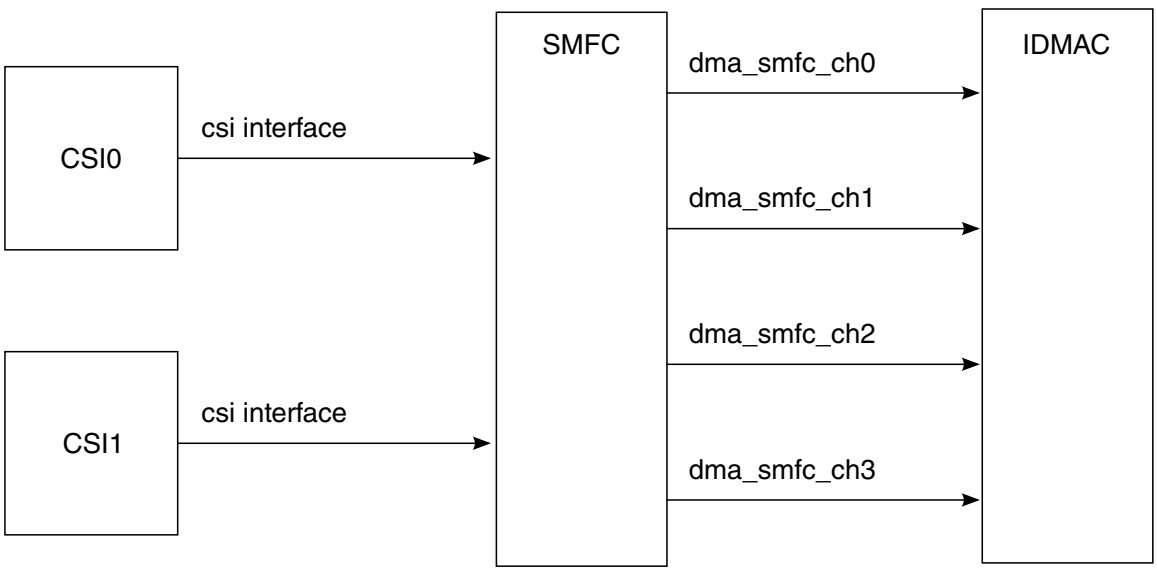

Figure 37-22. SMFC data flow

37.4.4.1 SMFC's Features

- Support two CSI masters and four DMA channels
- Automatic FIFO size calculation

37.4.4.2 SMFC's Functional description

SMFC supports up to four DMA channels. Each channel has a dedicated FIFO controller, as shown in the following figure. Sampled data and frame ID are kept in the buffers until the buffer is selected by Round Robin Priority Mechanism. Then, the content of ID buffer is compared to CH#_MAP bits and the corresponding FIFO controller is activated. As a result, the content of the buffer is copied to the RAM. The wptr and the "base" are used to calculate the location in the RAM. The rptr are following after wptr during dma_active signal, initiated by DMA.

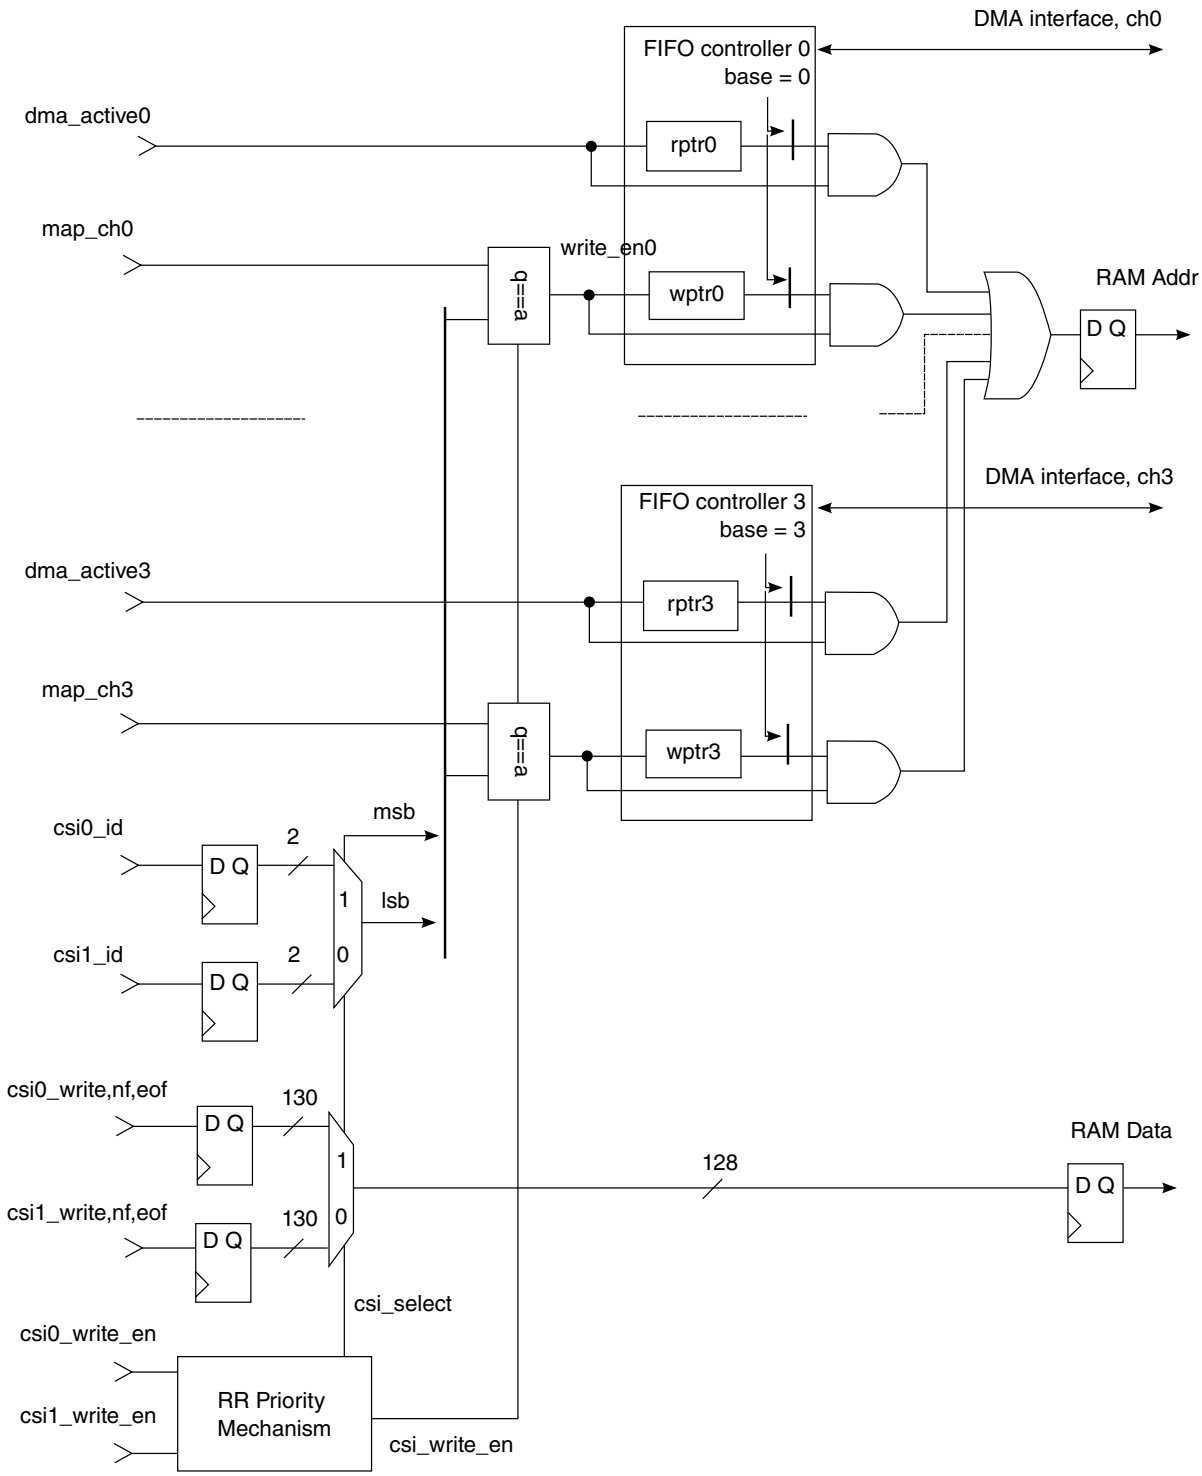

Figure 37-23. Sensor Multi FIFO Controller

Four FIFOs are implemented with single RAM due to the fact that the channels can't be active simultaneously. The memory space of SMFC is divided into four equal sectors. Each FIFO has a fixed base address - "base". The "base" used as MSB for corresponding pointer in order to calculate absolute address of the RAM. FIFO size of channels 1 and 3 are fixed and is equal to size of one sector. FIFO size of channels 0 and 2 depend from other channels as shown in the table below. Other configurations are not allowed.

Table 37-18. FIFO Channels

Number of DMA channels required	enable/disable of channels 3,2,1,0	FIFO size (sectors) per channels 3,2,1,0
1	0 0 0 1	0 0 0 4
2	0 1 0 1	0 2 0 2
3	1 1 0 1	1 1 0 2
4	1 1 1 1	1 1 1 1

NOTE

Channels should not be enabled after activation of channel 0 or/and channel This can cause to overlapping of FIFO areas and other malfunctions.

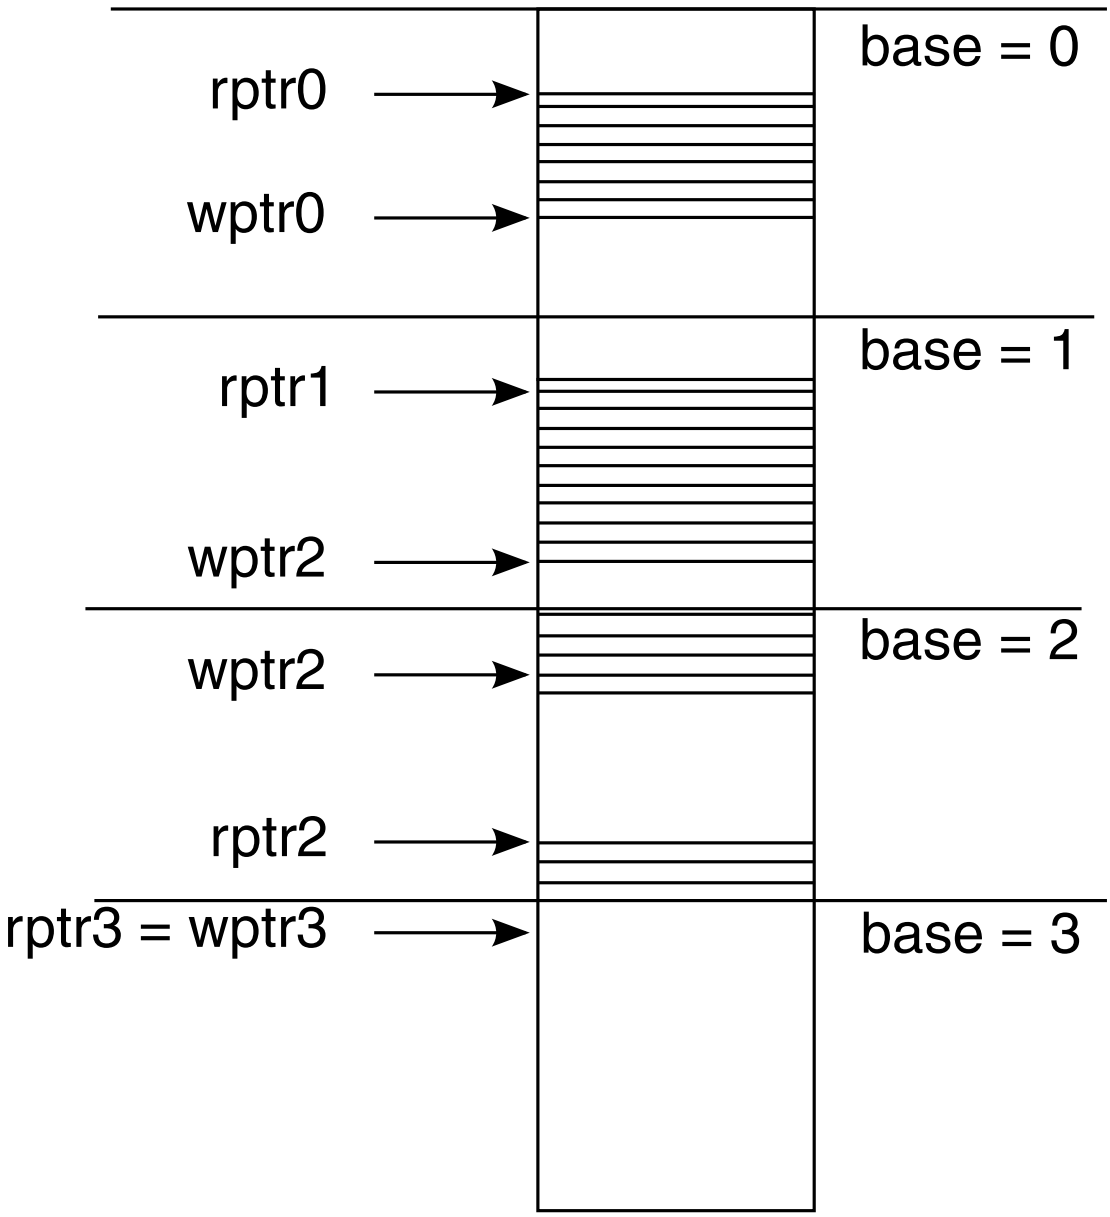

Figure 37-24. SMFC memory map when DMA channels 3,2,1,0 are enabled

37.4.4.2.1 SMFC Master interface.

SMFC Master interface is shown in the following figure.

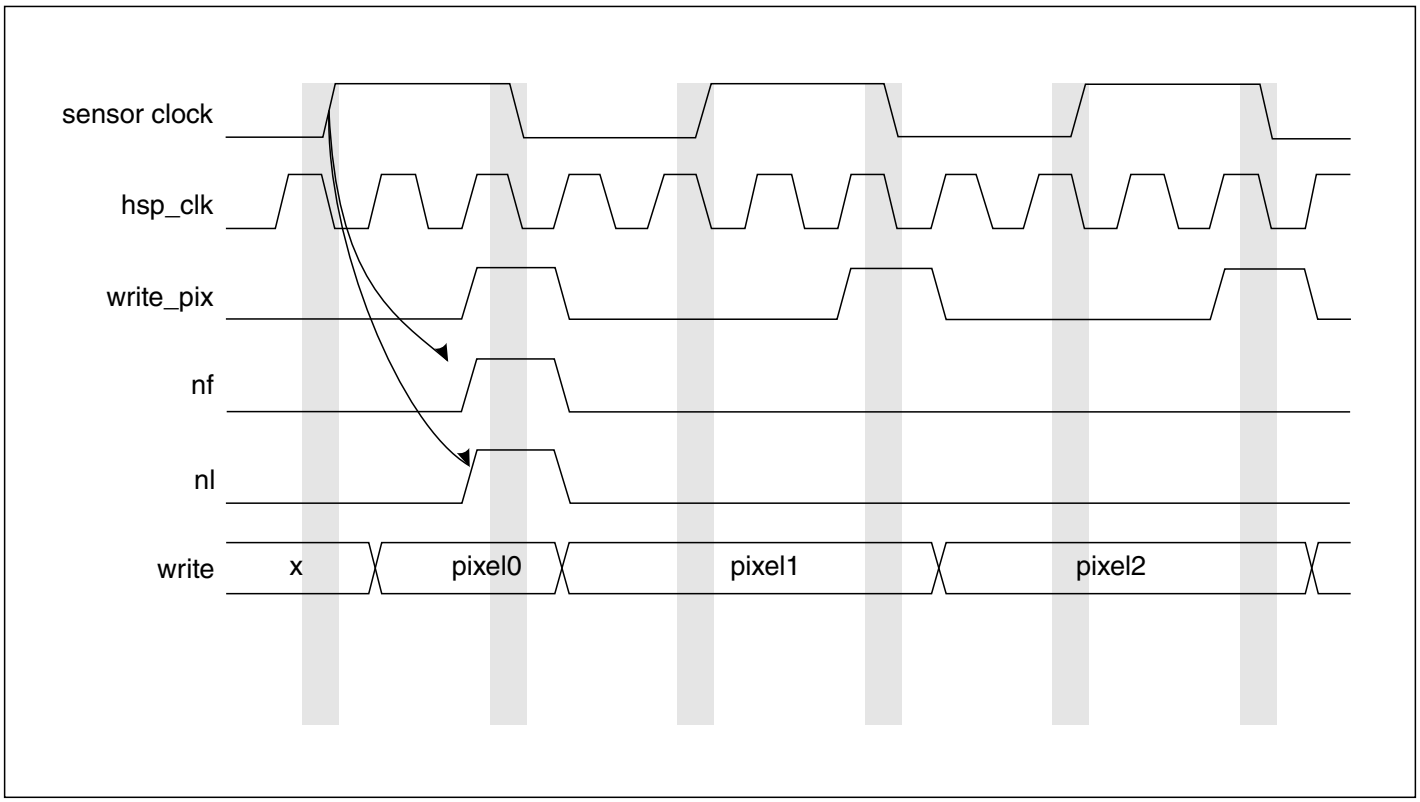

Figure 37-25. Timing diagram of SMFC slave interface

Sensor clock can be asynchronous to IPU clock (hsp_clk). The CSI synchronize data arrived from the sensor to hsp_clk. The csi_write signal indicates when data on csi_pix bus can be sampled by hsp_clk clock.

37.4.4.2.2 Restrictions

1. DMA channels should not be enabled after activation of channel 0 or/and channel 2. This can cause to overlapping of FIFO area and other malfunctions.
2. Watermark set value should be greater than watermark clear value.
3. One frame should not be mapped to few DMA channel.

37.4.5 Image Converter

37.4.5.1 IC Block Diagram

The IC contains three processing sections: downsizing, main processing and rotation.

The block is controlled via the peripheral bus registers. Some processing parameters should be written by the ARM core to the Task Parameter Memory. Writing to the memory is performed via the AHB bus.

The IC Block Diagram is shown in the following figure.

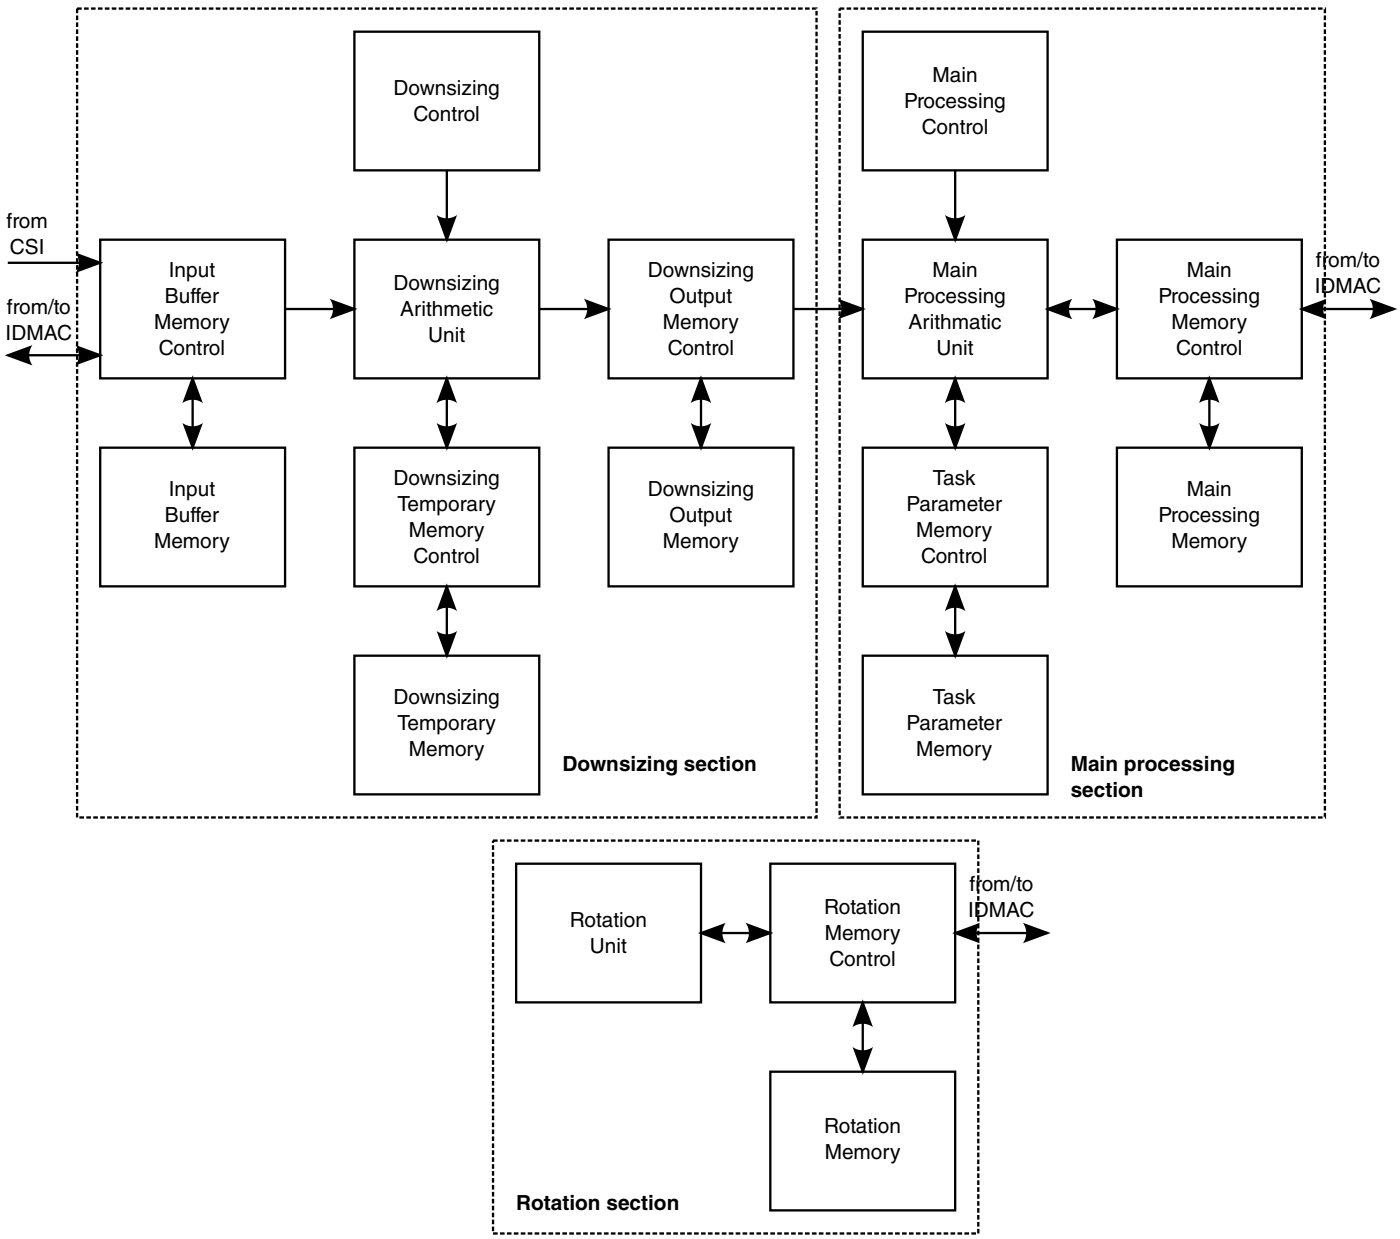

Figure 37-26. IC Block Diagram

37.4.5.2 Processing tasks

Each of the three processing sections performs up to three processing tasks with time sharing:

1. Preprocessing task for encoding.
2. Preprocessing task for displaying image from sensor (viewfinder).

3. Postprocessing task.

The tasks are performed by single hardware. The ARM platform configures each task before enabling it.

Tasks switching is transparent for the ARM platform. The time unit for task switching in the downsizing section corresponds to a processing time of one burst of eight pixels, in the main processing section - to a processing time of one image line, in the rotation section - to a processing time of one image frame.

All three tasks include similar operations controlled by commands. Task configuring consists in definition of commands for each task, as described in the following table.

Table 37-19. Task Commands

Command code	Command	Processing unit	Command parameters	Description
EN	Task Enable	DSU, MPU		Task will enabled from next frame. Task 1 is preprocessing for encoding. Task 2 is preprocessing for viewfinder. Task 3 is postprocessing.
	Downsizing	DSU	Downsizing ratio (GCR)	Downsizing ratio 1:1, 2:1, 4:1
	Resizing	MPU	Resizing ratio (GCR)	Resizing ratio from 2:1 to 1:M Resizing ratio = N:M; M =2^13; N = floor(M*(SI-1)/(SO-1)); SI - input size; SO - output size
CSC1	Color space conversion 1	MPU	Color conversion coefficients and offsets (TPM)	Color conversion matrix 1
GLOB_A	Global alpha	MPU		Used only for Task 2 and Task 3
CMB	Combining	MPU		Combining video with graphics. Used only for Task2 and Task3.

The ARM platform writes the commands to the IC_CONF Register. Because there is no double buffering for all the IC parameters, the ARM platform must disable a task before changing its parameters. After being disabled, the task is still allowed to complete its current frame execution. At frame finish, the IPU sends an interrupt to the ARM platform indicating that the ARM platform can change task parameters. The ARM platform enables the task again and task execution is resumed from start of the next frame.

37.4.5.3 Downsizing Section

The sensor data from the CSI is written into a FIFO located in the Input Buffer Memory. Depending on programmed processing flow, the FIFO data can be sent to the system memory via the IDMAC or straight forward to the Downsizing Unit.

In the first case, the data is processed by the ARM platform and returned by the IDMAC to another FIFO located in the Input Buffer Memory.

For postprocessing, the IDMAC transfers a data from the system memory to the third FIFO. The data is read by the Downsizing Unit when the postprocessing is performed.

Each or three FIFOs has 128 pages. Each page can store one burst of 2 or 4 words which corresponds to 8 or 16 pixels. The size of the burst is defined according to the channel's corresponding CB#_BURST_SIZE bit. The memory word width is 128 bits. Each memory word contains color components of four adjacent pixels or 16 bytes of generic data (e.g. Bayer). Access to the FIFOs is controlled by the Input Buffer Memory Control.

The Downsizing Unit performs averaging and decimation of image pixels both in horizontal and vertical directions according to the following equations:

$$HP_{R,c} = \frac{1}{DS\_R\_H} \sum_{k=0}^{DS\_R\_H-1} IP_{r+k,c}$$

$$VP_{R,C} = \frac{1}{DS\_R\_V} \sum_{l=0}^{DS\_R\_V-1} HP_{R,c+l}$$

where IPr,c - the input pixel, HPR,c - the pixel after horizontal downsizing, VPR,C - the pixel after vertical downsizing, DS_R_H and DS_R_V - the horizontal and vertical downsizing ratios according to the IC_PRP_ENC_RSC, IC_PRP_VF_RSC and IC_PP_RSC Registers. The final calculation result is rounded to 8 bits.

Each of three downsizing tasks processes the data by bursts of 8 pixels. Normally, the current task runs until emptying the corresponding input FIFO. After finishing burst processing, the Downsizing Unit may switch between the current task and another task with higher priority, if the Input Buffer Memory has received a burst for this new task.

Averaging is performed firstly in the horizontal direction. All color components of a pixel are processed in parallel. After horizontal averaging has finished for a single output pixel, the new pixel value is added to the corresponding pixel value of a temporary row derived from previous averaging steps. This provides vertical averaging of the pixels. The temporary row is stored in the Downsizing Temporary Memory. The memory word width matches one accumulated pixel width (36 bits). There are three temporary rows stored in this memory - one per downsizing task.

After vertical averaging has been finished, the output row is written to the Downsizing Output Memory. The memory word of 48 bits includes two output pixels. For each task, the memory has a double buffer of one row. When the Downsizing Unit fills the foreground part of the double buffer, the Main Processing Unit takes pair or pixels from the background part. After the new downsized row has been ready, the foreground and background memory pointers are swapped.

37.4.5.4 Main Processing Section

The Main Processing Unit reads pairs of pixels from the Downsizing Output Memory background part. It processes the complete pixel row for the current task and after that switches to another task if the input data for this new task is ready.

For each task, the Main Processing Unit is able to perform the following sequence of operations:

1. Horizontal flipping the image (optional) performed with reading from the Downsizing Output Memory. Flipping is enabled via the VF, HF & ROT parameters of the corresponding DMA channels (Table 37-14 and Table 37-15) responsible for output of the task results. The preprocessing task for encoding uses the VF, HF & ROT parameters from IDMAC channel #20, the preprocessing task for viewfinder - from the IDMAC channel #21, the postprocessing task - from the IDMAC channel #22.
2. Horizontal resizing by bilinear interpolation between two adjacent pixels received from the Downsizing Output Memory according to the equation:

$$HP_{R,c} = IP_{r,c} + RS\_C\_H \cdot (IP_{r+1,c} - IP_{r,c})$$

where RS_C_H - the current horizontal resizing coefficient. The calculation result is rounded to 8 bits. The resizing coefficient is calculated as

$$RS\_C\_H = \left(\sum_{k=0}^{R-1} RS\_R\_H \right) \bmod(8196)$$

where RS_R_H - the horizontal resizing ratio from the IC_PRP_ENC_RSC, IC_PRP_VF_RSC and IC_PP_RSC Registers. The RS_R_H parameter is equal to a numerator N of the resizing ratio N:M with M =2^13.

The resulting row of the horizontal resizing is stored in the Task Parameter Memory.

3. Vertical resizing by bilinear interpolation between the current and previous results of horizontal resizing. Both current and previous results of horizontal resizing is stored in the Task Parameter Memory. Resizing is accomplished according to the equation:

$$VP_{R,C} = HP_{R,c} + RS\_C\_V \cdot (HP_{R,c+1} - HP_{R,c})$$

where RS_C_V - the current vertical resizing coefficient. The calculation result is rounded to 8 bits. The resizing coefficient is calculated as

$$RS\_C\_V = \left(\sum_{k=0}^{C-1} RS\_R\_V \right) \bmod(8196)$$

where RS_R_V - the horizontal resizing ratio from the IC_PRP_ENC_RSC, IC_PRP_VF_RSC and IC_PP_RSC Registers. The RS_R_V parameter is equal to a numerator N of the resizing ratio N:M with M =2^13.

At completion of vertical resizing, this row is updated - the current result of horizontal resizing replaces the previous one.

4. First color space conversion YUV to RGB or RGB to YUV with the conversion matrix CSC1. The conversion matrix coefficients are programmable. They are stored in the Task Parameter Memory. The conversion equations are:

$$Z_0 = 2^{SCALE-1} \cdot (X_0 \cdot C_{00} + X_1 \cdot C_{01} + X_2 \cdot C_{02} + A_0)$$
$$Z_1 = 2^{SCALE-1} \cdot (X_0 \cdot C_{10} + X_1 \cdot C_{11} + X_2 \cdot C_{12} + A_1)$$
$$Z_2 = 2^{SCALE-1} \cdot (X_0 \cdot C_{20} + X_1 \cdot C_{21} + X_2 \cdot C_{22} + A_2)$$

where for YUV to RGB: X_0=Y, X_1=U, X_2=V, Z_0=R, Z_1=G, Z_2=B, for RGB to YUV: X_0=R, X_1=G, X_2=B, Z_0=Y, Z_1=U, Z_2=V.

All the parameters of the conversion matrix are written by the ARM platform to the Task Parameter Memory (IC Task Parameter Memory). The final calculation result is limited according to the SAT_MODE parameter and rounded to 8 bits.

5. Combining video with graphics. There are the following combining options:
   - local alpha blending,
   - global alpha blending,
   - use of key color.

   If both alpha blending and color keying are enabled, color keying has higher priority (graphic pixels of the key color are fully transparent independently on the alpha value).

   Combining mode is selected via the IC_CONF Register. The combining equation is:

$$OP = IGP \cdot \alpha + IVP \cdot (1 - \alpha)$$

   where IGP - an input graphics pixel, IVP - an input video pixel, α=(A+floor(A/128))/256 - an alpha value, A - a global or local transparency parameter. The global A is written in the IC_CMBP_1 Register, the local A arrives together with the graphics pixel.

   A graphics pixel becomes transparent when color keying is enabled and a pixel color matches a key color (independently on an alpha parameter).

   The graphics data is read from a FIFO located in the Main Processing Memory. The FIFO contains 32 pages of size of 8 pixels. The size of the burst is defined according to the channel's corresponding CB#_BURST_SIZE bit. The graphics pixel format in the FIFO is RGB or RGBA or YUV 4:4:4 or YUVA. The graphics data is loaded by the IDMAC to the FIFO from the system memory.

All the operation are executed by an unified processing unit sequentially. Steps 1 and 2 cannot be interrupted by another task. All other steps can be interrupted by a task with higher priority if an input row is ready for this task. Preprocessing tasks priority is higher than postprocessing task priority.

The processing unit consists of three identical parts for each color component. All three color components are processed in parallel. Each of the processing operations can be enabled or disabled by an appropriate command according to.

The processing results are written to an output FIFO located in the Main Processing Output Memory row-by-row. The FIFO contains 32 pages, each page can include one burst of 8 or 16 pixels. The size of the burst is defined according to the channel's corresponding CB#_BURST_SIZE bit. The IDMAC transfers the output bursts to the system memory or to the display via DMFC (Channel 21only). The Main Processing Memory contains three buffers for each tasks: the temporary row buffer, the graphics FIFO and the output FIFO. Each memory word (128 bits) stores 4 adjacent pixels in formats RGB or RGBA or YUV 4:4:4.

37.4.5.5 Rotation Section

The rotation section includes the Rotation Memory, which stores an input rectangular block of 8x8 pixels and an output FIFO containing four pages of 8 pixels each one. The Rotation Memory word width corresponds to four adjacent pixels - 96 bits. The input block is loaded to the memory by the IDMAC like to a FIFO.

The Rotation Unit rewrites pixels from the input block to the output FIFO with corresponding relocation of a pixel inside the block. Rotation and/or left/right flipping and/or up/down flipping are enabled separately for each of three tasks. Configuring the rotation and flipping options is performed via the VF, HF & ROT parameters of the corresponding DMA channels (Table 37-14 and Table 37-15) responsible for task data input. The preprocessing task for encoding uses the VF, HF & ROT parameters from the IDMAC channel #45, the preprocessing task for viewfinder - from the IDMAC channel #46, the postprocessing task - from the IDMAC channel #47.

Rotation and flip options are shown in the following table.

Table 37-20. Rotation and Flip Options

ROT	FLR	FUD	Image
0	0	0	

Table continues on the next page...

Table 37-20. Rotation and Flip Options (continued)

ROT	FLR	FUD	Image
			
0	0	1	
0	1	0	
0	1	1	
1	0	0	
1	0	1	

Table continues on the next page...

Table 37-20. Rotation and Flip Options (continued)

ROT	FLR	FUD	Image
			
1	1	0	
1	1	1	

After finishing the rotation task, the IDMAC returns the output FIFO content to the system memory. When writing to the system memory, the IDMAC changes a location of the block relative to an input block location in order to provide proper rotation of the whole frame. Rotation tasks switching is performed after completion of rotation of the whole frame.

37.4.5.6 IC Task Parameter Memory

The following table presents IC task parameter memory details.

Table 37-21. IC Parameters

Address[1]	Word[2]	Parameter	Field	Description
x2008	Encoding CSC1 word0 and word1	C22	8:0	Coefficients of color conversion matrix1 for encoding task: Z0 = X0*C00 + X1*C01 +X2*C02+A0; Z1 = X0*C10 + X1*C11 +X2*C12+A1; Z2 = X0*C20 + X1*C21 +X2*C22+A2;

1. The address documented in this table is the relative address within the TPM. This is the address that should be accessed when writing or reading from this memory via the AHB bus.
2. Each word is aligned to 64 bit accessible via the AHB bus in 2 separate 32bit accesses.
3. s - sign position, x - binary digit position

37.4.5.7 IC's DMA channels

The table below mas the IDMAC channels of the IC and the IRT to the corresponding tasks.

The IC's channel name is the name of the channel at IC level. The IC channel name is referred on the IC's programming model.

Table 37-22. IC's DMA Channels

IDMAC's channel number	IC's channel name	Read/ Write	Source	Destination	Processing Flow Purpose
20	CB0	Write	IC ENC	Memory	Preprocessing data from IC (encoding task) to memory
21	CB1	Write	IC VF	Memory/DMFC	Preprocessing data from IC (viewfinder task) to memory; This channel can be configured to send the data directly to the DMFC. This is done by programming the ic_dmfc_sel bit.
22	CB2	Write	IC PP	Memory	Postprocessing data from IC to memory

Table continues on the next page...

Table 37-22. IC's DMA Channels (continued)

IDMAC's channel number	IC's channel name	Read/ Write	Source	Destination	Processing Flow Purpose
14	CB3	Read	Memory	IC VF	Graphics data for combining (viewfinder task)
15	CB4	Read	Memory	IC PP	Graphics data for combining (post-processing task)
11	CB5	Read	Memory	IC PP	Postprocessing data from memory
12	CB6	Read	Memory	IC VF	Preprocessing data from sensor stored in memory (for example Bayer)
5	CB7	Write	IC	Memory	Direct data from IC (sensor data) to memory
48	CB8	Write	ENC ROT	Memory	Preprocessing data after rotation (encoding task)
49	CB9	Write	VF ROT	Memory	Preprocessing data after rotation (viewfinder task)
45	CB10	Read	Memory	ENC ROT	Preprocessing data for rotation (encoding task)
46	CB11	Read	Memory	VF ROT	Preprocessing data for rotation (viewfinder task)
50	CB12	Write	PP ROT	Memory	Postprocessing data after rotation
47	CB13	Read	Memory	PP ROT	Postprocessing data for rotation

37.4.5.8 IC restrictions

- The input's frame width to the IC must be a multiplication of 8 pixels
- When performing resizing the frame width must be multiple of burst size - 8 or 16 pixels as defined by CB#_BURST_16 parameter.

37.4.5.9 IC bridge

The IC sub-block utilizes a single memory to serve read and write channels. These memories are the IBM, RM and MPM. The IDMAC has separate mechanism to handle read and write channels. As a result, a contention between read and write channels may occur on each one of the memories. In order to resolve the contention, an IC bridge sub-block is connected between the channels associated with this memory.

The bridge prioritizes a read channel over a write channel. In order to avoid starvation of the write channels, the user can limit the maximum consecutive requests of the same channel that will be served. The limitation is done by programming the memory's corresponding <>_brdg_max_rq field.

37.4.6 Display port

The display port handles all the IPU features targeted for controlling and sending data to the display. The display port consists of 4 modules.

DC - a display controller,

DP - a display processor,

DMFC - a display multi-FIFO controller

DI - a display interface. The DI is instantiated twice to provide two symmetrical display interfaces.

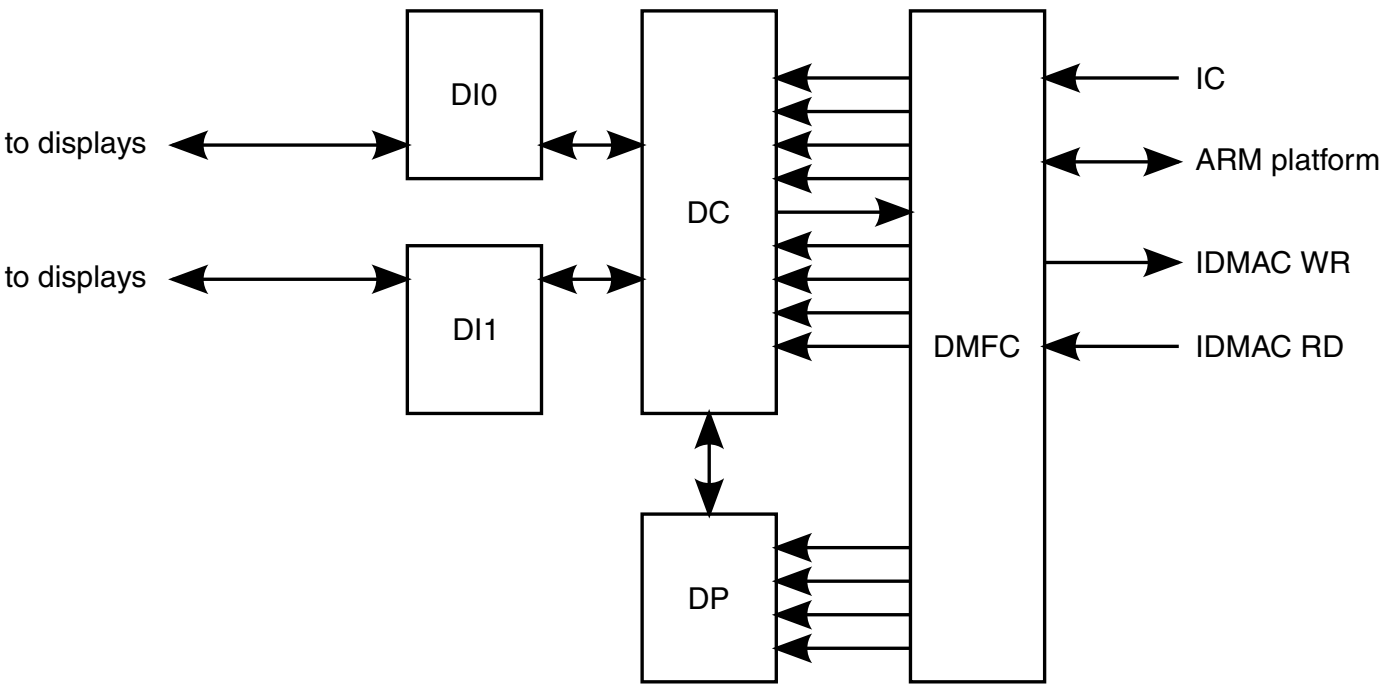

Figure 37-27. The display port

37.4.6.1 Display ports channels

The display port send data to the display over several channels. The data source may be the system's memory (via the IDMAC) the IC block and the ARM platform. The display port can read data from the display and send it to the ARM platform or IDMAC.

The data is routed over channels. The table below maps the IDMAC channels to DMFC, DC, DP channels and describes each channel.

Table 37-23. Display port channels

IDMAC's channel number	Display port's destination	DMFC channel number	DC channel number	Corresponding alpha channel	channel usage
21	DC	Programmable using dmfc_ic_in_port	Programmable using dmfc_ic_in_port	NA	This channel is coming from the IC module. When data is coming from the IC, the IC channel replaces one of the IDMAC's channels connected to the DMFC. When the IC_DMFC_SEL bit is set the output of the IC is routed to the DMFC. This channel can be routed to the DC channels 1,2,5B,5F,6B,6F. Routing this channel to the DC channel is done with the dmfc_ic_in_port bits. The DC's channel allocated to the IC channel can't be used for data coming from other source.
23	DP	5B	5	51	This channel is for the DP's primary flow. When a single plane is used, the data should be sent over this channel. When 2 planes are combined in this flow, the second plane should come on channel 27.
24	DP	6B	6	52	This channel is for the DP's secondary flow. When a single plane is used, the data should be sent over this channel. When 2 planes are combined in this flow, the second plane should come on channel 29.
27	DP	5F	5	31	This channel is for the DP's main flow. When a single plane is used, the data should be sent over channel 23 and this channel should not be used. When 2 planes are combined in this flow, one plane should come on channel 23 and the other plane on this channel.
28	DC	1	1	NA	This channel can serve sync and async flows. When channel 28 is connected to DI0, channel 23 must be connected to DI1 even if ch23 is not used. This is done by programming the PROG_DISP_ID_5 field
29	DP	6F	6	33	This channel is for the DP's secondary flow. When a single plane is used, the data should be sent over channel 24 and this channel should not be used. When 2 planes are combined in this flow, one plane should come on channel 24 and the other plane on this channel.
40	DC	0	0	NA	This is a read channel
41	DC	2	2	NA	This channel can serve only async flow
42	DC	1C		NA	Command stream. See Display port's restrictions
43	DC	2C		NA	Command stream. See Display port's restrictions
44	DC	3		NA	Mask channel. This mask channel can be associated with channel 23 or channel 28

37.4.6.2 Supported display interfaces

- The display port has 2 DI interfaces. Each interface can handle up to 3 displays.

- The total number of supported displays is 4.
- Each DI can handle up to 2 async interface - only one of them can be serial interface.
- Each DI can handle one synchronous interface. Asynchronous displays that are accessed in synchronous mode are considered synchronous interface.

37.4.6.2.1 Synchronous Interfaces

The DI supports the following synchronous display interfaces.

1. Synchronous generic interfaces to TFT dumb displays or RGB interfaces of smart displays.
2. Synchronous interfaces to Sharp displays.
3. Synchronous interfaces to TV encoders:
   - PAL
   - NTSC

   TV interfaces can operate in progressive or interlaced modes.
4. Synchronous interface to a graphic accelerator
5. BT.656
6. BT.1120

   BT.1120 and BT.655 support

   BT.1120 and BT.656 are supported. Only video data is supported, sending data during blanking intervals is not supported. The component size is always 8 bit.

37.4.6.2.2 Asynchronous Parallel Interfaces

The DI has a flexible asynchronous interface. The interface include 2 chip selects (CS) and 7 general purpose control signals.

The user can decide which of the 7 signals will be associated to each one of the asynchronous displays (up to 2 displays per DI). The using can configured some of the control signals to be shared by more than one display.

37.4.6.3 Display port's bandwidth

When the IPU clock (HSP_CLK) is equal to 264Mhz, the peak bandwidth supported by the display port is as follows

For on chip devices (like on chip MIPI-DPI bridge)

- 240 Mega-Accesses/Sec if the DI clock is derived from an external to IPU source (like another PLL)
- 264 Mega-Accesses/Sec if the DI clock is derived from the IPU clock (HSP_CLK)

For off chip devices (Like an external LCD)

- 170 Mega-Accesses/Sec if the DI clock is derived from an external to IPU source (like another PLL)
- 180 Mega-Accesses/Sec if the DI clock is derived from the IPU clock (HSP_CLK)

An access can be a pixel, component or generic data.

37.4.6.4 Display Dual Mode

This mode is useful for smart display with synchronous interface. The data is sent to the display only when the data has changed or when the display processor's settings are changed. The physical interface to this display has synchronous interface's characteristics.

37.4.6.5 Display Errors

There are a few types of errors that may impact the image sent to the display. The IPU provides some automatic mechanisms, which allow the system to overcome these errors.

37.4.6.5.1 Data starvation errors

These types of errors may happen for synchronous displays if the data is ready at the DI to be sent to the display at the time point it is required. This anomaly may happen if the system is very loaded and the IDMAC was not able to read data from the external memory and provide it to the DMFC.

Frame boundary errors

In case that a new frame should be sent to the display but the data of the previous frame was not sent completely, the IPU will reset the display modules and flush the internal buffers, as the IPU expects that the new frame indication will be triggered at least 2 lines (blanking interval) before the actual data is to be sent. The should recover and be ready with the data of the new frame within the blanking interval period.

Error within a frame

In case that a pixel was missed within a frame i.e. the pixel did not arrived to the DI on time. The IPU has 2 ways to handle the situation. The mode is selected by configuring the DI#_ERR_TREATMENT bit.

Redo the last access. The IPU will keep sending the last access to the display. The IPU will drop any pixel that arrive till the end of the line. If the data of the next line arrives correctly the IPU will continue working normally as overcame the problem. In case that the data of the next line is also incorrect the IPU will perform the same procedure as described on frame boundary errors.

Freeze the clock. In this mode, the IPU freezes the clock sent to the display till the correct data arrives. In order to avoid a case where the clock is frozen forever and the system is stuck: when the clock is frozen, a watchdog timer starts counting. When the timer completed counting the IPU will perform the same procedure as described on frame boundary errors. The number of cycles to be counted by the watchdog timer is defined according to the DI#_WATCHDOG_MODE bits.

37.4.6.5.2 Anti tearing errors

In case of anti tearing errors, the IPU indicates about the error by asserting the corresponding DC_TEARING_ERR_# bit.

See also Antitearing control.

37.4.6.6 Display port's restrictions

- In case where 2 synchronous flows are used and additional asynchronous flow via DP is used. The asynchronous flow via DP can be targeted to the same DI that the synchronous flow via DP is targeted.
- There are only 2 command channels (42 and 43). Command channels are associated with data channels (24,28,41).
  - When channel 28 is associated with a command, the command stream will come from channel 42
  - When channel 41 is associated with a command, the command stream will come from channel 43
  - Channel 24 can be associated with a command stream only if channel 28 or channel 41 do not use a command stream. If channel 28 is not associated with a command stream then channel 24 can be associated with channel 42. If channel 41 is not associated with a command stream and channel 28 is associated with a command stream then channel 24 can be associated with channel 43.

- A channel that uses an alternate flow, cannot be associated with a command stream (ch. 24 or ch. 41)
- In case of a synchronous display using external clock, The DI where the synchronous display is connected to can be connected to another async display. But, it can support only the write direction. Read via the asynchronous interface cannot be performed if this DI uses external clock

37.4.7 DC - Display Controller

IPU handles few display flows supporting few displays.

The IPU's flows' data sources can be the ARM platform, the system's memory, a camera or an external device connected on the display's port such as an external graphic accelerator.

The data's destination can be any device connected on one of the DI ports.

The DC controls the flows coming to and from the DI port. The DC manages the flows, decides which flows are currently active and when each flow is activated. The arbitrates between the active flows, gets the data from the predefined source and distribute it to the correct DI.

The DC's core is the microcode. The microcode contains a set of routine. A routine is built of a set of commands stored in the template's (microcode) memory. For each event (like new frame, end of frame etc.) a specific routine is executed. The user writes the routines and map them to a specific events. The routine contains instructions to the DC about the way of handling the data/address/commands associated with the display. The routine may contain information about the data's mapping, about waveform's characteristics, and more.

The figure below shows the micro architecture diagram for the DC block

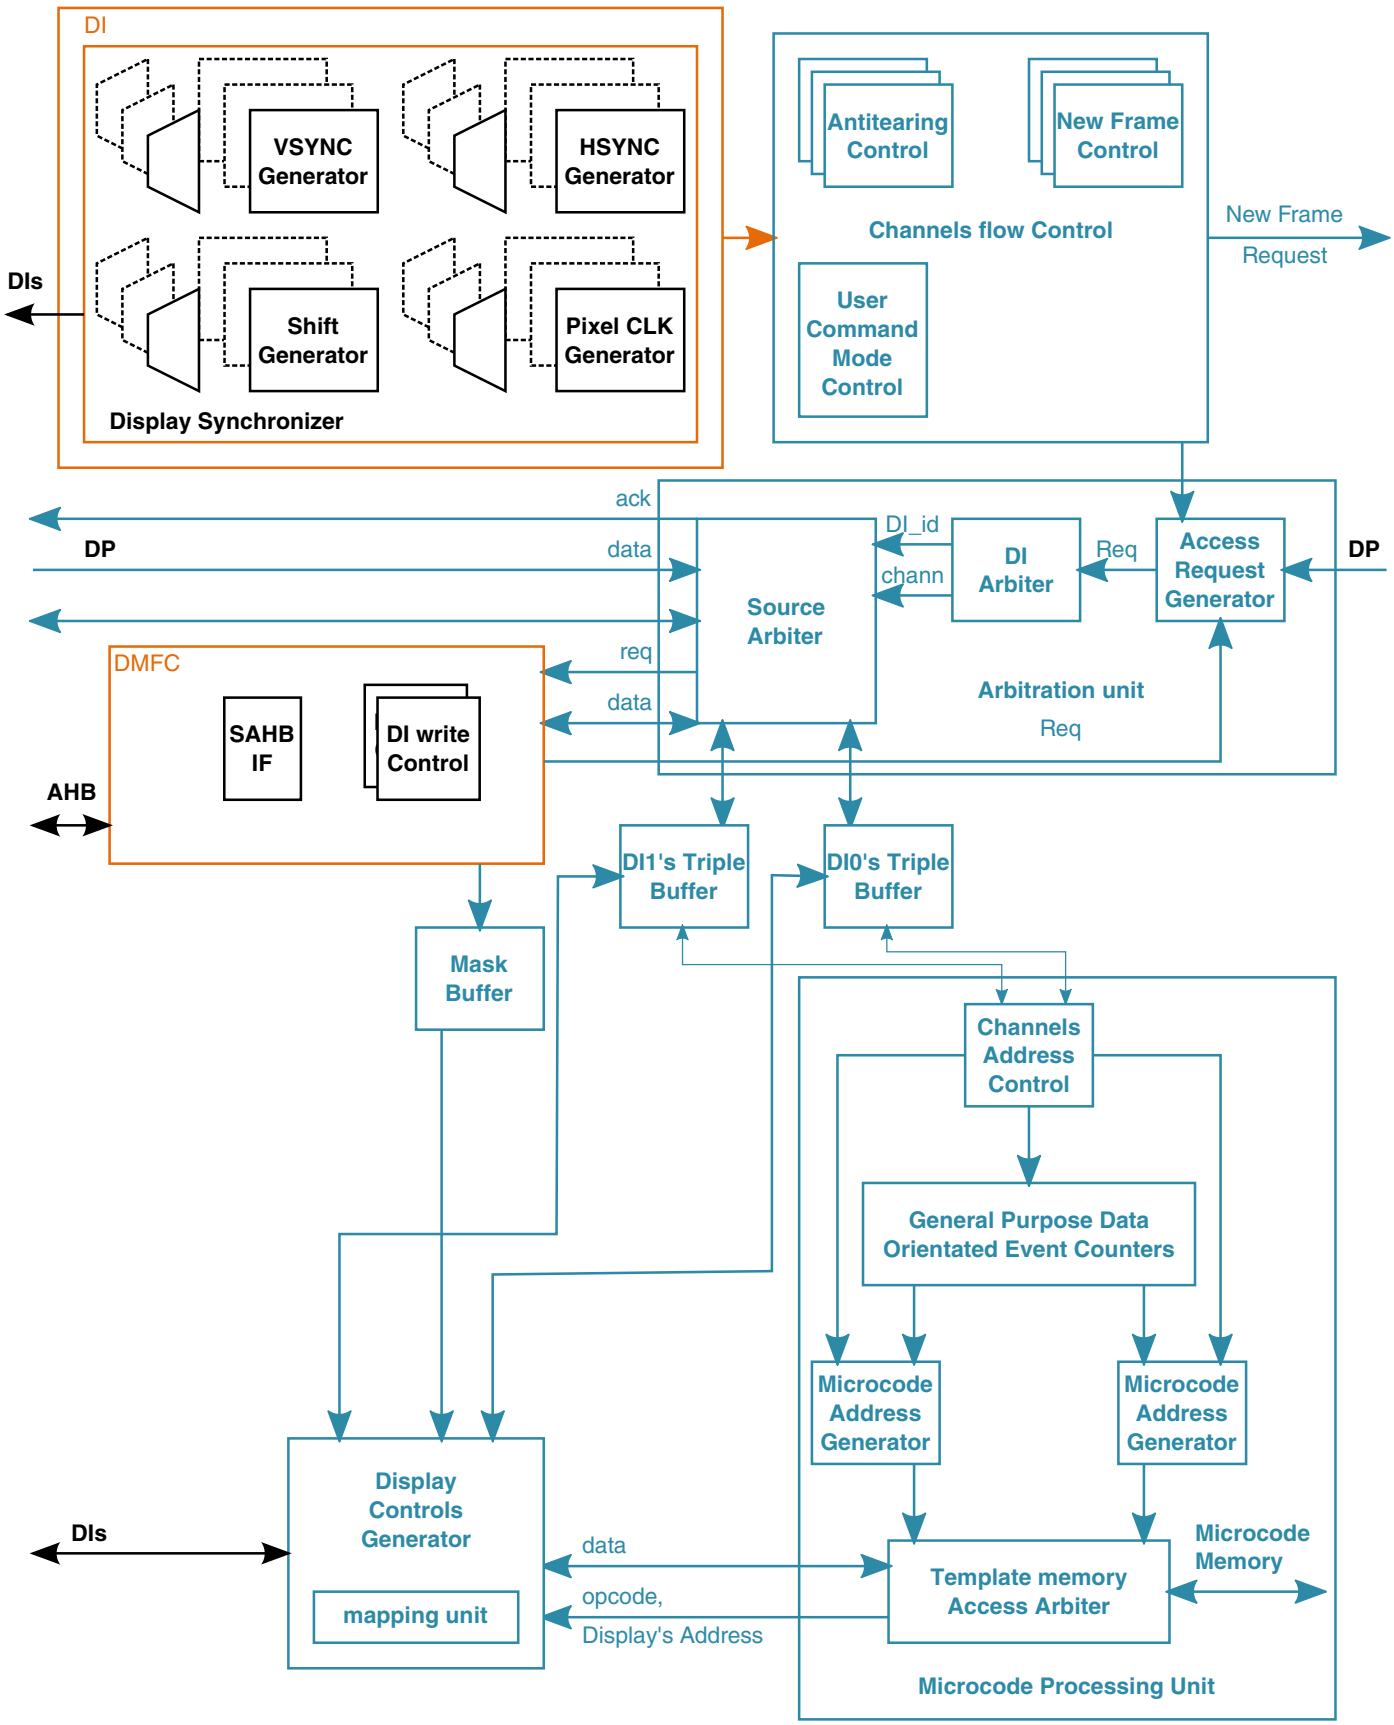

Figure 37-28. DC - Display Controller Block Diagram

37.4.7.1 Channels flow control

37.4.7.1.1 New Frame control

The channels flow control schedules the flows handled by the DC

For asynchronous flows the scheduling is done according to a request coming from the Frame Synchronization Unit (FSU) on the control sub-block (CM).

For synchronous flows the scheduling is done according to a trigger that is generated by a timer located on the one of the display's interface blocks (DI)

37.4.7.1.2 Antitearing control

Anti tearing mechanism uses a signal indicating on a display's refresh of a frame.

The supported tearing elimination triggers can be:

- An internally generated VSYNC signal
- A VSYNC signal generated by the display. The data source is the memory.
- A VSYNC signal coming from the CSI

The DC has the capability to avoid image tearing. For asynchronous flows where the source of the data is the system's memory or postprocessing, the DC monitors the position of a display's refresh pointer. Writing to the display is started only after crossing the window start point by the display refresh pointer. After that, writing to the display is allowed only when a write pointer does not advance beyond the refresh pointer. To provide anti-tearing mode, a window start time (in rows) must be defined in the PROG_START_TIME_1, PROG_START_TIME_2, PROG_START_TIME_5, PROG_START_TIME_6 registers for the corresponding channels.

The antitearing mechanism is limited to a case where only asynchronous flows are handle via the target DI.

In the case when tearing cannot be avoided (when the refresh rate is too high and the refresh pointer overtakes the write pointer after full refresh cycle), an error interrupt is generated. Tearing elimination mode can be disabled via the PROG_CHAN_TYP field for the corresponding channel.

37.4.7.1.3 User command mode control

A user may prepare in the system's memory a buffer that holds commends to be sent to the external device. The command buffer includes the same amount of lines as the data buffer. The line of commands are sent to the display line by line. A line of data is sent following each line of commands. This mode is activated by programming the PROG_CHAN_TYP of the corresponding channel.

The structure of the command is as follows:

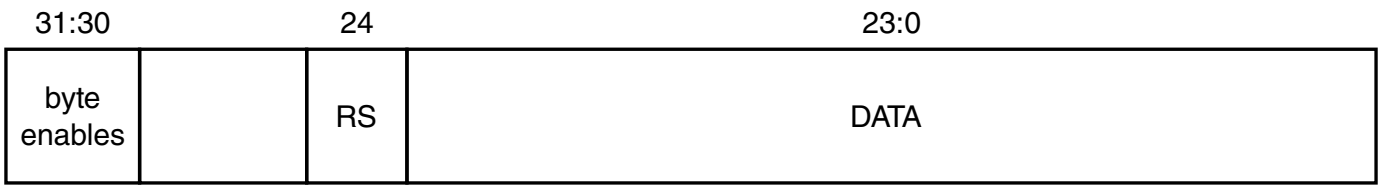

Figure 37-29. Structure of a command word

37.4.7.2 Arbitration Unit

This unit arbitrates the requests coming from the DMFC and from the DP and sends them to corresponding DI.

37.4.7.2.1 Access request generator

The requests coming from the DMFC or DP are sorted according to the target DI and then served according to a hard coded priority. The priority order is Sync flow, ARM platform access, IDMAC's Async flows.

37.4.7.2.2 DI arbiter

This units arbitrates between the DIs. The priority is hard coded. The priority order is Sync flow, ARM platform access, IDMAC's Async flows.

In case of 2 simultaneous requests to different DIs with the same priority the requests are served in a Round-Robin fashion. In case of 2 simultaneous Sync flow requests to different DI, the user can bypass the Round Robin mechanism and prioritize one DI on the other according to the SYNC_PRIORITY_1 & SYNC_PRIORITY_5 bits. Setting low priority to both of these channels is forbidden.

37.4.7.2.3 Source arbiter

Once the source of the request to be served was selected and the target DI was chosen, this unit routes the request and all the signals, associated with it, to the correct triple buffer and to the correct source of the data.

37.4.7.3 Microcode processing unit

The main control unit of the DC is the Microcode processing unit (MPU).

The data coming to the DC may be associated with some additional information like new frame, new line, new address etc. The information is processed in the MPU. The MPU executes the associated routine. The routine includes a set of instructions of the actions to be performed by the DC and DI.

37.4.7.3.1 Channels address control

This unit controls the display's address for each channel. This unit is responsible for defining the next address to be accessed (by incrementing or jumping). Stores special events flags (like EOF, EOL etc.). Based on the display's address and the special events, the type of the routines to be executed is defined.

37.4.7.3.2 General purpose Data oriented events counters

A user may define up to 4 general purpose events. The events are triggered by a standard event (NF, NL). The standard event restarts a counter, when the counter completes counting the user's general purpose event is asserted. This event activates a routine like any other events

37.4.7.3.3 Microcode address generator

This unit calculates the physical address of the template memory where the event associated routine resides. In addition, these unit arbitrates between simultaneous events and select the event to be served.

The arbitration is done according to a user defined priority. The priority of each event is set according to the #_CHAN_PRIORITY_CHAN_# bits of each channel. There are 2 modes of arbitration:

- Serving all the pending events according to the priority
- Serving only the highest priority event while ignoring all the other events

The arbitration mode is defined according to the CHAN_MASK_DEFAULT bit of each channel.

37.4.7.3.4 Template's Memory Access Arbiter

This unit gets memory access requests from the 2 microcode address generator units and arbitrates between them in a Round Robin fashion. In case that only one of the requests belongs to a synchronous flow, this request is selected.

37.4.7.4 DC's Template structure

The template memory contains 256 template words. Each template word is a 42 bits words. Accessing a template word require 2 accesses (32bit each).

DC template's fields description

Table 37-25. DC template's fields description

Field	Description
STOP	Stop bit - This bit should be set in order to indicate that the current command is the last command of the routine
OPCODE	The command's code
OPERAND	The command's operand - for some of the commands this field can hold a parameter associated with the command
MAPPING	The MAPPING field holds a pointer to a register holding 3 fields: MAPPING_PNTR_BYTE0_X, MAPPING_PNTR_BYTE1_X, MAPPING_PNTR_BYTE2_X. This pointers point to sets of OFFSET and MASK parameters that define the mapping scheme. MAPPING = 0 means that mapping is disabled. The value in this field should be incremented by 1 to get the correct X pointer value In order to point to MAPPING_PNTR_BYTE2_0, MAPPING_PNTR_BYTE1_0, MAPPING_PNTR_BYTE0_0 the user should write 1 to the MAPPING field
WAVEFORM	For data oriented output pins. The IPU has 4 waveform generator units. The IPU holds 12 sets of waveforms' configuration registers called DI0_DW_GEN_<i> and DI1_DW_GEN_<i>

Table continues on the next page...

Table 37-25. DC template's fields description (continued)

Field	Description
	The WAVEFORM field defines which one of the 12 waveforms' configuration registers is used. The DI1_DW_GEN_X register holds a pointer to one of the 4 waveform generators units for each of the data oriented pins. 0 - The waveform of the data oriented output pins is not affected 1 -Points to DI0_DW_GEN_0 or DI1_DW_GEN_0 2 - Points to DI0_DW_GEN_1 or DI1_DW_GEN_1 ... 12 - Points to DI0_DW_GEN_11 or DI1_DW_GEN_11
GLUELOGIC	For signals generated by waveform generator #3; This field provides extra flexibility on the signals waveform
	GLUELOGIC[6] - This bit defines if we are in clock mode (1) or CS mode(0). 1- clock mode When the command is related to the display clock's pin then only if we are in clock mode, GLUELOGIC[5:4] are valid. 0- CS mode When the command is related to the CS pin then only if we are in CS mode, GLUELOGIC[3:0] are valid.
	GLUELOGIC[5:4] - clock mode settings 00 - Freeze the display clock following the execution of the current command 01 - Freeze the display clock before the execution of the next command to be executed 10 - Enable (unfreeze) the display clock following the execution of the current command 11 - Enable (unfreeze) the display clock before the execution of the next command to be executed
	GLUELOGIC[3] - CS mode settings 1 - Once the signal is asserted then it remains asserted (high or low according to the polarity) 0 - No impact on the waveform
	GLUELOGIC[2] - CS mode settings 1 - Once the signal is negated then it remains negated (high or low according to the polarity) 0 - No impact on the waveform
	GLUELOGIC[1] - CS mode settings 1- The current waveform can be attached to the previous waveform. If the previous waveform was asserted and the current waveform start asserted the two waveforms will be attached so the signals' waveforms will be consecutive. This impact the behavior of the previous waveform. This can be done only if GLUELOGIC[0] of the previous waveform is set to 1 0 - No impact on the waveform
	GLUELOGIC[0] - CS mode settings 1 - this bit allows the next waveform to be attached to the current waveform.
SYNC	The data associated with this command should be synchronized to the DI's one of gen_time_sync generators' output. 0000 - No sync. The data is sent without any synchronization to any event 0001 - Sync with unit #1 0010 - Sync with unit #2 ...

Table 37-25. DC template's fields description

Field	Description
	1010 - Sync with unit #10 1011 - 1111 Reserved

DC template's command description

The diagram below illustrates the command processing flow. The command is being fetched from the microcode memory. The Opcode is decoded. According to the decoding several controls are sent to the processing unit. In addition the processing unit gets the pixel's data and the display's address. The processed data/ address is stored in an internal register. There are 2 types of commands

HOLD - In this type of commands the data/address is stored in the register and not sent to the DI. The data/address is held in the register for further processing in the following commands.

WRITE - In this type of commands the data/address is stored in the register and also sent to the DI.

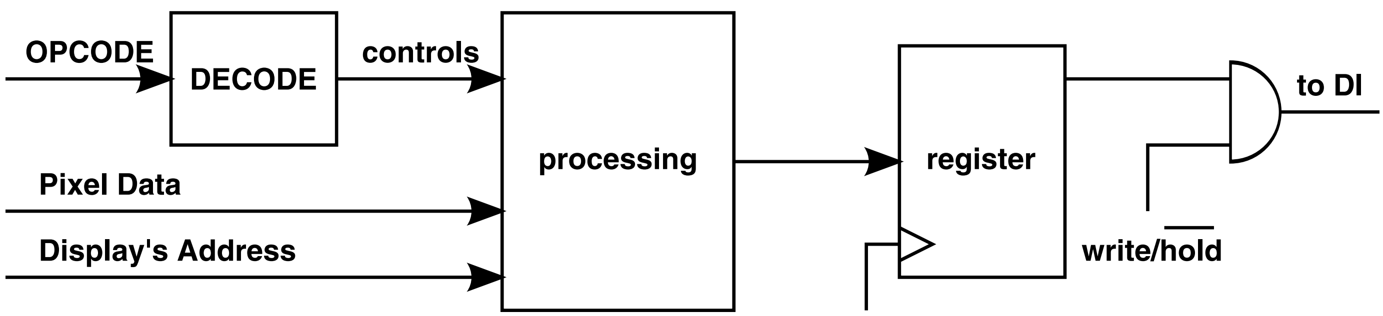

Figure 37-31. Opcode processing

The table below describes the DC's Commands.

BMA	S 0 0 1 1 LF AF 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 N 0 0 SYNC
	BRANCH_MICROCODE_ADDRESS jump to Microcode address which is stored at an internal Microcode address register. The branch will be done to the ADDRESS stored with the HMA/HMA1 command. The BMA command manages the repeat cycles by one of the auto decrement counters (internal counters), the counter's id is defined by LF-bit (0/1) The N operand defines the N-number of routine's repetitions. In case of N=0. The BMA command functions as a JUMP command. As long as the internal counter didn't reached its predefined value, the microcode will branch to the pre defined address stored by the HMA/HMA1 commands. Selecting between HMA and HMA1 is done by the AF bit (it is calculated according to the "1 - AF" value). - That's the subroutine's microcode start address When the counter reached its predefined value, the microcode will branch to the pre defined address stored by the HMA/HMA1 commands. Selecting between HMA and HMA1 is done by the AF bit (it is calculated according to the "AF" value). - That's the subroutine's microcode return address BMA synchronization (SYNC field): The BMA command can be used for context switching between 2-channels. When switching between flows the user can run a routine for a new channel, which actually affects the previous flow. This feature is useful when a new flow breaks the current flow (post command for example): SYNC is used for display_id selection // 0 0 0 - current display // 0 0 1 - previous display // 1 0 0 - display 0 // 1 0 1 - display 1 // 1 1 0 - display 2 // 1 1 1 - display 3

37.4.7.5 Display controls' generator

This unit generates the control signals associated with the data that are sent to the DI block.

37.4.7.5.1 Bus Mapping Unit

The Bus Mapping Unit is responsible for programmable mapping of the input data and commands to the display interface format and vice versa. Address mapping is done by this unit as well (programmable via micro code).

The internal DI format for data and commands is a 24-bits word divided into three byte components (eight zeroes are added to MSB for 16-bits words from the DC). This word can be output or input in one, two, three or four cycles of the display clock.

The word coming from the memory is a 32bit word. The mapping operation is done on 24 bits only. The 24 bit are selected from the received 32 bit according to the W_SIZE_# field. The 24 bit input word is partitioned to a 3 bytes (3X8bits). Each byte can be mapped to any position at the 24bit output word. The exact position is set according to the MD_MASK & MD_OFFSET fields.

The MAPPING_PNTR_BYTE0_X, MAPPING_PNTR_BYTE1_X, MAPPING_PNTR_BYTE2_X fields holds the pointers for the MD_MASK & MD_OFFSET for each byte.

The MAPPING field holds a pointer to a register holding 3 fields: MAPPING_PNTR_BYTE0_X, MAPPING_PNTR_BYTE1_X, MAPPING_PNTR_BYTE2_X.

0 - no mapping i.e. 32 bits are sent as is.

1 - points to MAPPING_PNTR_BYTE0_0, MAPPING_PNTR_BYTE1_0, MAPPING_PNTR_BYTE2_0

2 - points to MAPPING_PNTR_BYTE0_1, MAPPING_PNTR_BYTE1_1, MAPPING_PNTR_BYTE2_1

...

30 - points to MAPPING_PNTR_BYTE0_29, MAPPING_PNTR_BYTE1_29, MAPPING_PNTR_BYTE2_29

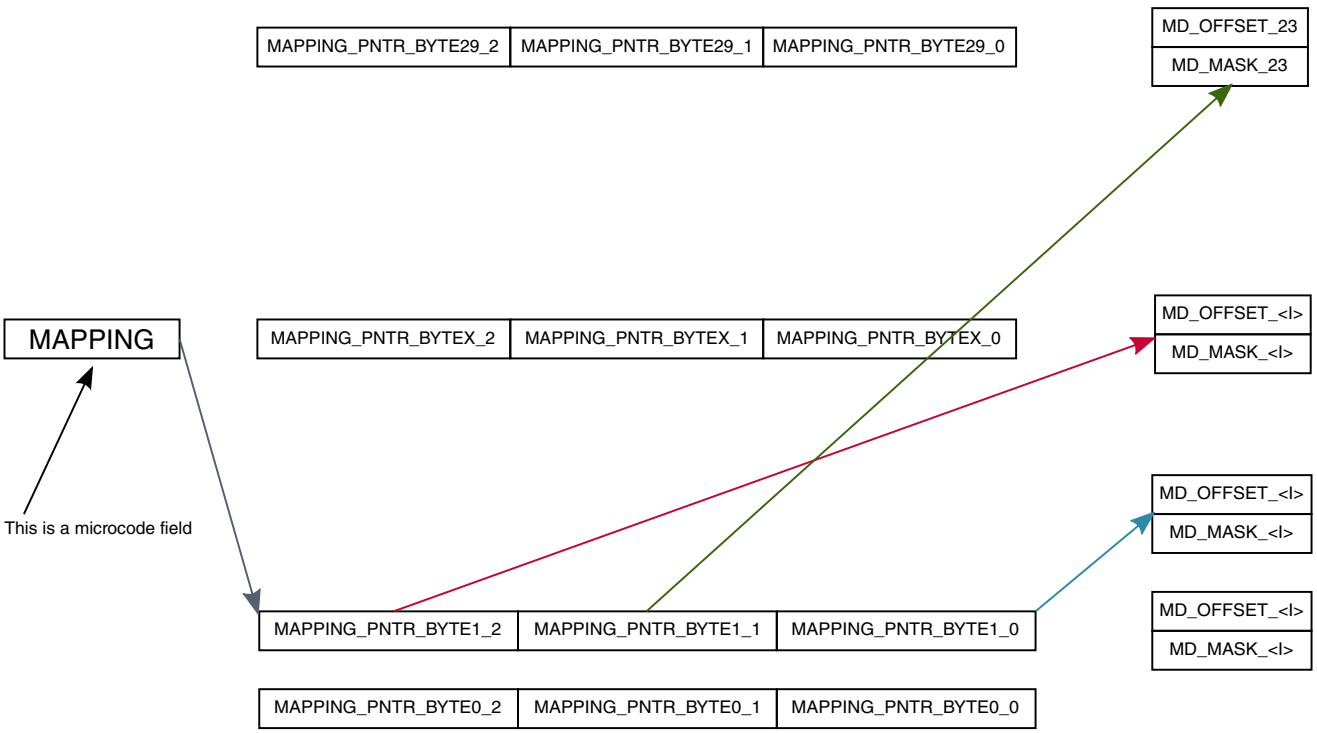

Figure 37-32. Mapping scheme

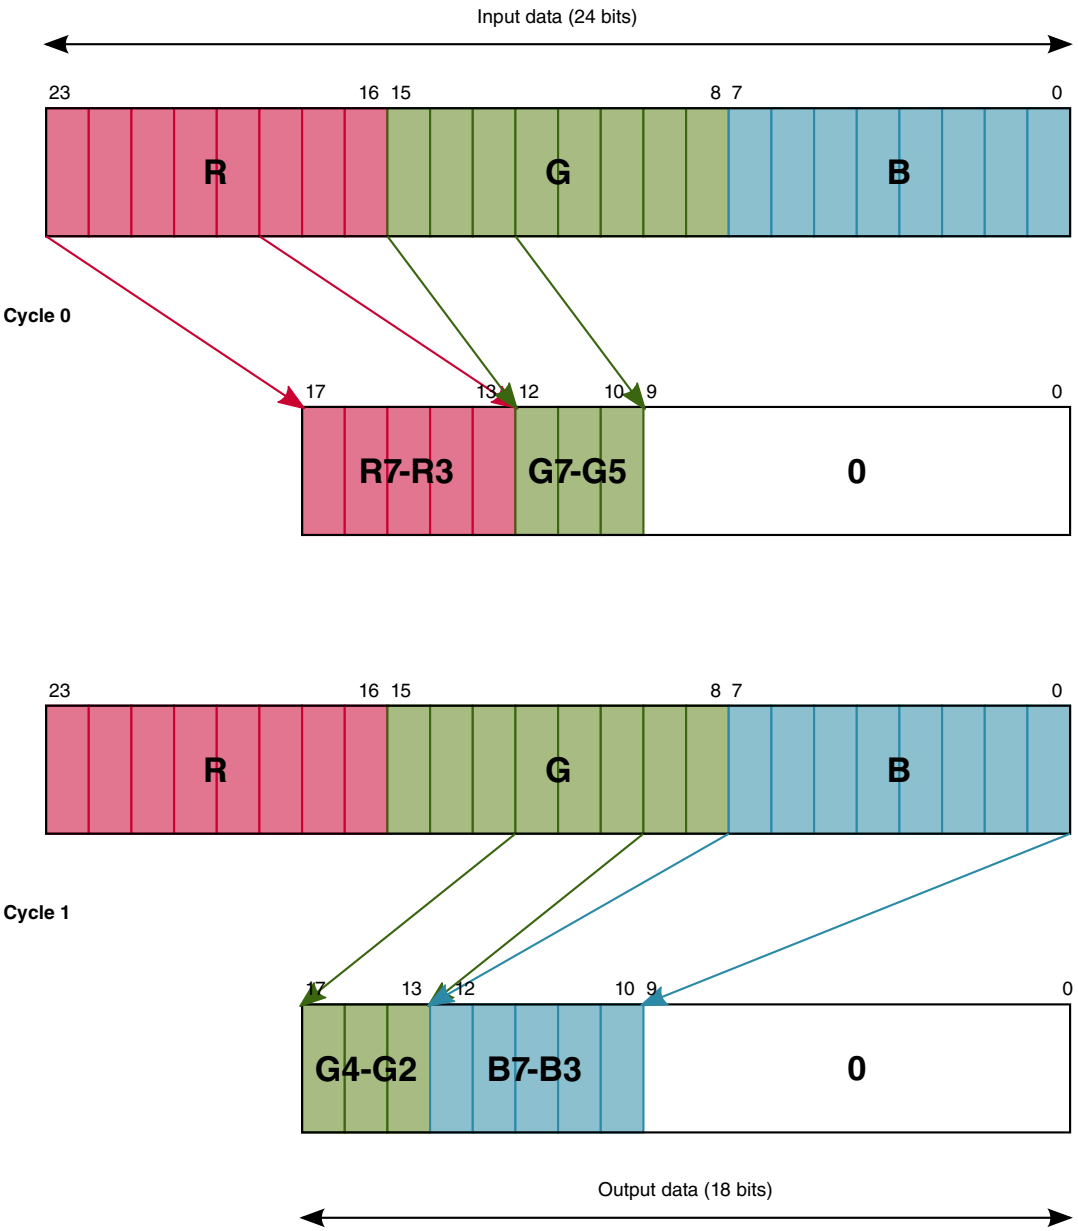
The mapping rule written in each of the Registers defines two types of parameters for the specific byte component and display:

1. Offsets of the byte component MSB relative to the output word LSB. Because the offsets can change dynamically, they are defined separately for the display clock cycles zero, one and two.
2. Numbers of the display clock cycles at which every bit of the byte component should be valid on the display bus. There are eight such 2-bit numbers in the Register.

Figure 37-33 presents an example of programming data packing for one of displays. Cycle 0 and Cycle1 in the diagram represent two separate atomic operations performed by the microcode template.



Cycle 0

MD_OFFSET_[R] - 0x11; MD_MASK_[R] - 0xF8

MD_OFFSET_[G] - 0xC; MD_MASK_[G] - 0xE0

MD_OFFSET[B] = 0x0; MD_MASK_[B] = 0x0

Cycle 1

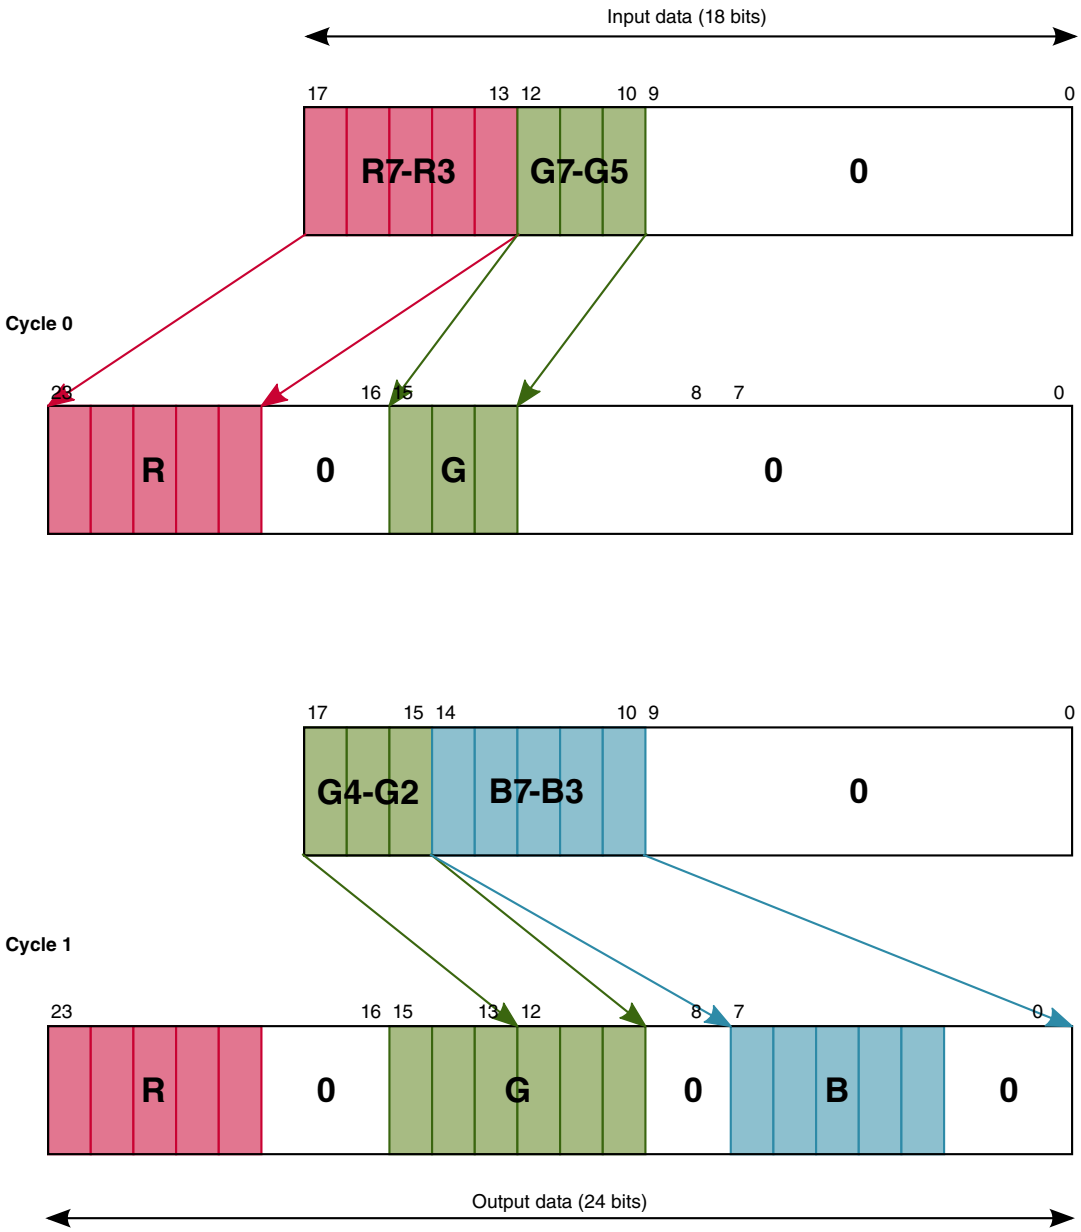
MD_OFFSET_[R] = 0x0; MD_MASK_[R] = 0x0

MD_OFFSET_[G] = 0x14; MD_MASK_[G] = 0x1C

MD_OFFSET_[B] = 0XE; MD_MASK_[B] = 0xF8

Figure 37-33. Example of Data Packing for Writing Data to the Display

The following figure presents an example of programming data packing for one of displays. Cycle 0 and Cycle1 in the diagram represent two separate atomic operations performed by the microcode template.



Cycle 0

MD_OFFSET_[R] - 0x11; MD_MASK_[R] - 0xF8

MD_OFFSET_[G] - 0xC; MD_MASK_[G] - 0xE0

MD_OFFSET[B] = 0x0; MD_MASK_[B] = 0x0

Cycle 1

MD_OFFSET_[R] = 0x0; MD_MASK_[R] = 0x0

MD_OFFSET_[G] = 0x14; MD_MASK_[G] = 0x1C

MD_OFFSET_[B] = 0XE; MD_MASK_[B] = 0xF8

Figure 37-34. Example of Data Unpacking for Reading Data from the Display

The same packing/unpacking registers are used for parallel and serial interface.

37.4.8 DMFC - Display Multi FIFO Controller

The following figure shows the block diagram for the DMFC block.

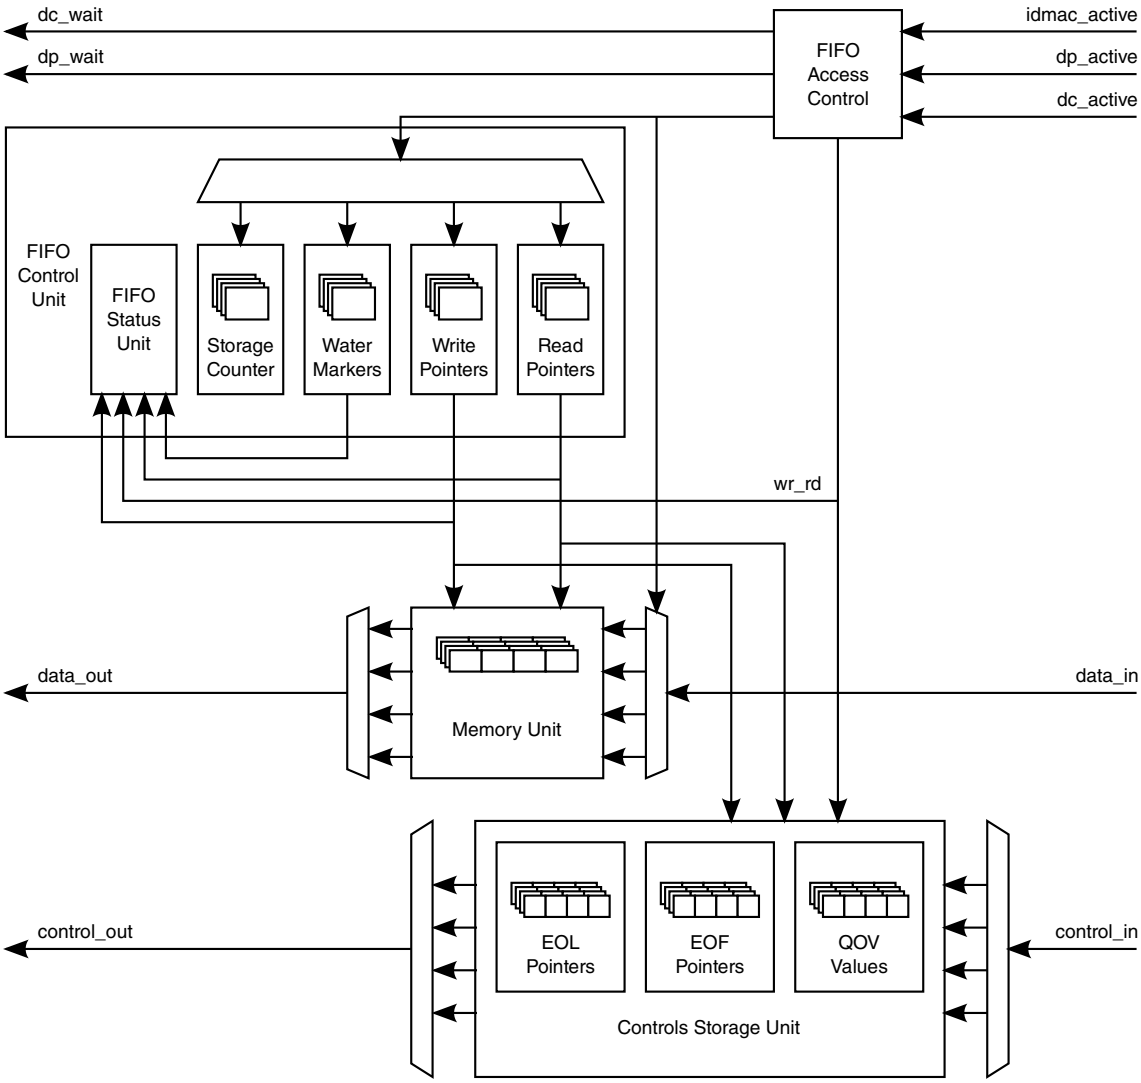


Figure 37-35. Display Multi Fifo Controller Block Diagram

The Display Multi Fifo Control manages Multi channels FIFOs. The DMFC serves the following clients:

- IDMAC - both read and write
- DP - read only
- DC - both read and write

- IC - write only
- AHB - both read and write

The DP and the DC read channels are physically attached to an IDMAC or an IC channel. As the IC has only one output channel connected to the DMFC. When the input is coming from the IC it replaces a channel that was physically attached to the IDMAC. The DMFC uses a single physical memory that serves the DP and DC read channels. The AHB accesses to the DC and the DC's write channel (read from display) use a separate physical memory.

The DMFC's write FIFO is built of 1024 entries of 128-bits each.

37.4.8.1 DP and DC read channels

Each one of the DP and the DC read (read from memory) channels is physically attached to an IDMAC read channel. A portion of the physical memory is allocated for each channel. The DMFC arbitrates between channels according to a predefined priority.

The DMFC controls each of the FIFOs

- Assert a request any time there's available place on the FIFO.
- Make sure that there's available place on the FIFO to accept the coming data.
- Optionally assert a watermark indication to avoid starvation

37.4.8.1.1 FIFO allocation to channels

The physical memory is partitioned to 8 segments. For each channel the user has to define the start address at a segment's boundary using the DMFC_ST_ADDR parameter.

The size of the FIFO allocated to a channel is defined by the DMFC_FIFO_SIZE parameter. The user must allocate the FIFO and avoid overlapping between FIFOs.

The DMFC hold few special indications like EOF, EOL, EOFILD. The most important one is end of line (EOL). If the size of the FIFO is shorter than or equal to the IDMAC line's length (FW) than no special restrictions on the DMFC usage.

If the size of the FIFO is greater than the IDMAC line's length (FW) than the user has to be aware to the following restriction for each channel.

The DMFC has two operation modes which are distinguished by the wait4eot bit. For each channel the DMFC can store a maximum number of EOL indication. The maximum number of EOL indications of EOL is given in the table below.

Table 37-27. DMFC's number of EOL indications

IDMAC's Channel	Maximum lines on the FIFO
23	Up to 3 lines
27	Up to 2 lines
28	Up to 2 lines
Other	Up to 1 line

If the use case is that the number of EOL indications cannot exceed the maximum number of EOL indications than the user should have the wait4eot cleared.

If the use case is that the number of EOL indication can exceed the maximum number of EOL indications than the user should have the wait4eot set.

Having the wait4eot bit set has performance impact as the DMFC analyzes the data prior to sending it to the destination. In addition the DMFC cannot utilize the entire FIFO allocated to this channel.

The user need to specify the burst size of the IDMAC by setting the DMFC_BURST_SIZE field. This field must match the IDMAC settings. In case that the IDMAC's burst size is not a power-of-2 number, the value of this field should be rounded up to the nearest power-of-2 number. The burst size must not be greater than the FIFO's size.

37.4.8.1.2 Arbitration between channels

The arbitration between channels is fully hardware controlled. IDMAC has the highest priority. Then the synchronous channels. Then the asynchronous channels.

37.4.8.1.3 Watermark

The DMFC can generate a water mark signal for each channel. The watermark signal is sent to the IDMAC and dynamically increases the channels priority on the IDMAC's arbitration.

The watermark feature is enabled by the DMFC_WM_EN bit. The FIFO is partitioned to bursts. The user can set the watermark level at a burst boundary.

The watermark signal is set when the number of bursts on the FIFO + the number of already requested burst is smaller than the value specified on DMFC_WM_SET bit.

The watermark signal is cleared when the number of bursts on the FIFO + the number of already requested burst is greater than the value specified on DMFC_WM_CLR bit.

DMFC_WM_SET must be smaller than DMFC_WM_CLR.

37.4.8.2 IC interface

One of the IDMAC channels can be replaced by a flow coming from the IC using the DMFC_IC_IN_PORT. The user has to provide the IC's setting to the DMFC by programming the DMFC_IC_FRAME_WIDTH_RD, DMFC_IC_FRAME_HEIGHT_RD and DMFC_IC_FRAME_PPW_C fields. The burst size of the channel coming from the IC should always be programmed to 4 words.

37.4.8.3 DC write channel and AHB accesses

The second physical memory of the DMFC serves the

- IDMAC write channel (read from display)
- 2 AHB channels that can be read or write

The IDMAC write channel is programmed using the DMFC_RD_CHAN register in a similar way to the DC and DP read channels described above. The user has to provide the frame width and height for this channel and the pixel per word parameter.

The AHB channels are used from accesses via the AHB port to the display. The accesses are distributed between channels according to the MCU_T parameter.

37.4.9 DP - Display Processor

The display processor processes the image prior to sending it to the display. The main task performed by the DP is combining between 2 planes.

The DP has 2 input FIFOs holding the data of full plane and the partial plane. In addition the DP performs some image enhancement functions like gamma correction, Color space conversion including Gamut mapping.

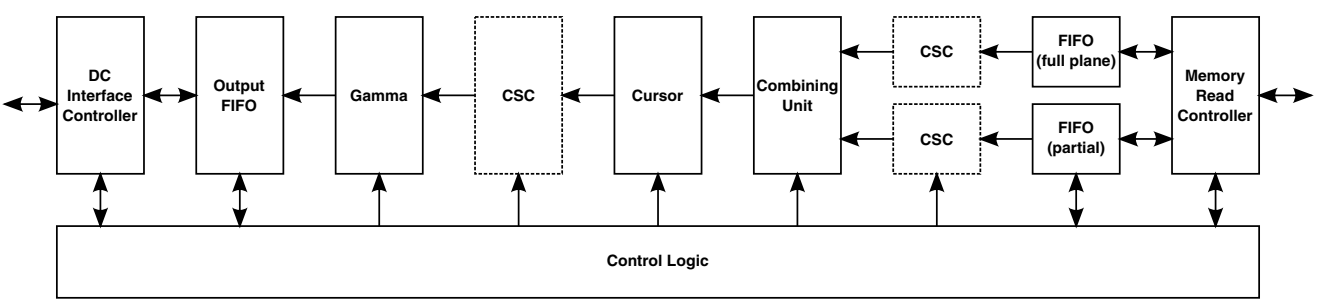

Figure 37-36. DP Micro architecture diagram

37.4.9.1 The DP programming model

The DP supports 3 flows. One sync flow and 2 Async flows. The DP holds 3 sets of registers. one set for each flow. Hence when referring to a register in this section the information is applicable to all the 3 sets. for example when referring to DP_COM_CONF, the information is applicable to DP_COM_CONF_SYNC, DP_COM_CONF_ASYNC0 and DP_COM_CONF_ASYNC1.

37.4.9.2 Displayed Planes

The following figure shows the planes displayed on a display.

There are full and partial planes. The partial plane's position is defined relatively to the upper left corner of the full plane (FGXP and FGYP parameters on the corresponding IPU_DP_FG_POS register). The size of the partial and full planes is defined on the corresponding IDMAC's channels' FW and FH parameters. The cursor position and parameters are set in the DP_CUR_POS register.

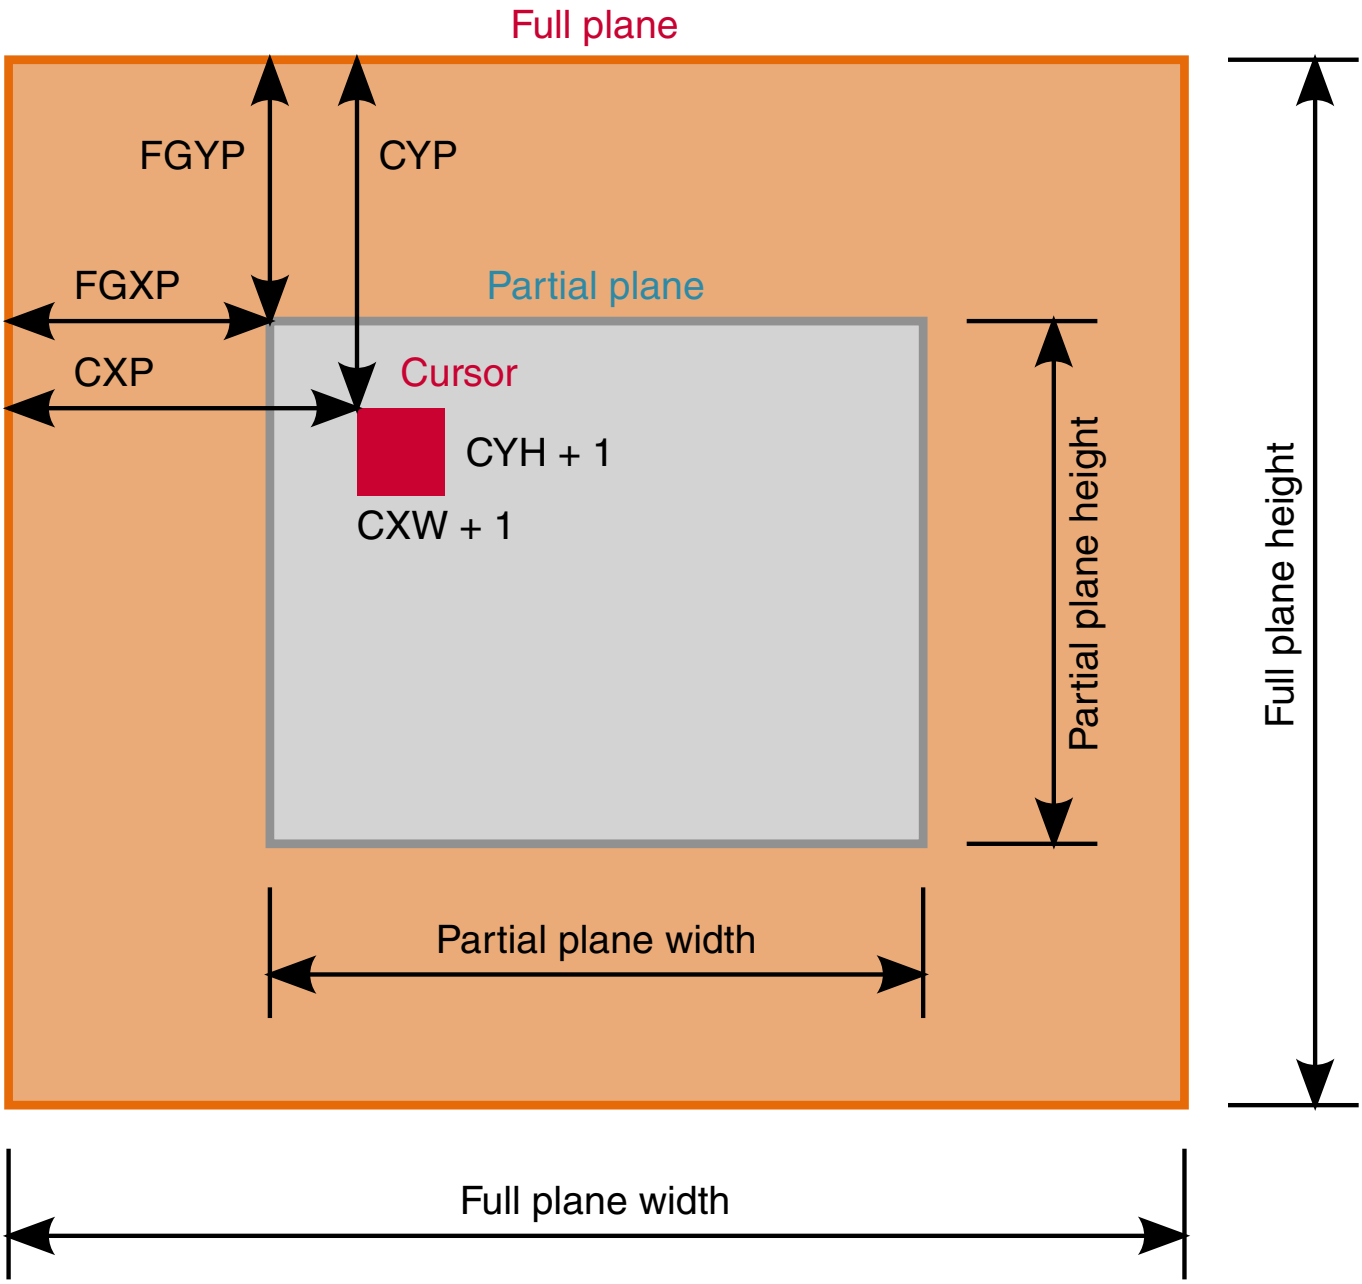

Figure 37-37. Displayed Planes

37.4.9.3 Combining Unit

The Combining Unit performs combining between the full and the partial planes. Each one of the planes may be graphics or video plane.

There are the following combining options:

- local alpha blending,
- global alpha blending,
- use of key color.
- order of the planes (full is presented over the partial plane and vice versa)

Combining mode is selected via the DP_COM_CONF Register. The combining equation is:

OP = BG*(1 - a) + FG*a

Where BG and FG are 2 input pixels; The DP_GWSEL bit defines if the BG is the pixel coming from the full plane or the partial plane.

a= (A+floor(A/128))/256 - an alpha value

A - a global or local transparency parameter.

The global A is written in the DP_GWAV field, the local A arrives together with the pixel.

A pixel becomes transparent when color keying is enabled and a pixel color matches a key color (independently on an alpha parameter). The color keying is defined on:DP_GWCKR, DP_GWCKG, DP_GWCKB

Combining takes 1 cycle per pixel. The Combining Unit outputs 24-bit words in the RGB/YUV format.

37.4.9.4 Cursor Generator

The Combining Unit output is passes through the Cursor Generator. The cursor's size and position are set via the DP_CUR_POS Register, a cursor color - via the DP_CUR_MAP Register. Different logic functions of combining the cursor with the image are supported as defined by the DP_COC field.

The cursor can be blinking. The blinking mechanism resides on the display controller sub-block. The blinking parameters are defined on the DC_BK_EN and DC_BKDVIV fields.

37.4.9.5 Color Space Conversion unit - CSC

The DP can get 2 input pixels from 2 different color spaces (YUV or RGB) and convert one of them to a common color space (YUV or RGB). In addition the 2 inputs can be of the same color space where the result is converted to another color space (YUV or RGB).

The DP has a single CSC unit that can be placed on one of 3 locations:

- At the output of one of the 2 input FIFOs
- At the output of the cursor generator.

Placing is done according to the DP_CSC_DEF field.

The color conversion implements a 3x3 matrix multiplication between the full RGB pixels and the color conversion constants, in order to obtain a YCC format image.

The conversion formula is:

x -> Clip(Round(S* 2^E)), S=Ax+B

where

A is a 3x3-dimensional matrix of weights, each a 10-bit signed number with 8 fractional digits

$$A = \begin{bmatrix} CSC\_A0 & CSC\_A1 & CSC\_A2 \\ CSC\_A3 & CSC\_A4 & CSC\_A5 \\ CSC\_A6 & CSC\_A7 & CSC\_A8 \end{bmatrix}$$

B is a 3-dimensional vector of offsets, each a 14-bit signed number with 2 fractional digits

$$B = \begin{bmatrix} CSC\_B0 & CSC\_B1 & CSC\_B2 \end{bmatrix}$$

S is a 3 dimensional vector of sums, each a 16-bit signed number with 4 fractional digits

S=Ax+B

E is an exponent, assuming one of the following values: -1,0,1,2 (allowing weights up to 8). The CSC_S parameters are encoded by 2 bits, please refer to the CSC_S parameter description.

$$E = [CSC\_S0\ CSC\_S1\ CSC\_S2]$$

A more explicit formula:

S[i] = (sum(A[i][j]*In[j]) >> 4) + (B[i] << 2) + (1 << (3-E[i]))

Out[i] = Clip(S[i] >> 4-E[i])

Where Clip() performs clipping to the range 0..255 (either per-component clipping or more sophisticated clipping that preserves the hue of the pixel)

37.4.9.5.1 Gamut mapping

When the color transformation produces colors outside the allowed range, they must be mapped back. This is called gamut mapping. The DP supports 2 clipping algorithms. (controlled by GAMUT_SAT_EN bit)

Hue preserving clipping algorithm is suitable only for RGB components. For YUV components, the per-component clipping algorithm is used.

Per component Clipping

This mapping is performed by clipping each of the components independently to its allowed range of values (the final value being uint8):

•Y: to 0..255 or 16..235 according to the SAT_MODE bit

•U/V: to 0.255 or 16..240 according to the SAT_MODE bit

Hue Preserving Clipping

Hue Preserving clipping is done in the following way

•First stage - eliminating negative values

```
N = min(R,G,B)
if (N<0) X-> X-N, where X=R,G,B
```

•At this stage, all components are non-negative and the MSB's beyond d=11 bits are ignored (assumed 0).

•Second stage - eliminating large values

```
M = max(R,G,B) (d-bit integer)
if (M>255)
```

```
M' = M >> (m-7), where m=8..d-1 is the index of the most-significant non-zero
bit in M
D' = Ceil(256*255/M') = 256..510 (since M' = 128..255)
Ceil(x) = the smallest integer which is not smaller than x
Implemented by a hard-wired 128x9-bit LUT
X -> min(255, (X*D')>>(m+1)), where X=R,G,B (8x9 multiplier)
else
X -> X
```

37.4.9.6 Gamma correction

The DP includes a gamma correction function. It is approximated by the piece-wise polynomial:

gammar = GAMMA_C<i> + ((R[4:0] * GAMMA_S<i>) >> 4 + 1)>>1

Where R is the input red component, that's a 9 bit input composed pixel_in*2+pixel_in[7].

Single approximation slope is used for Gamma Correction of red, green and blue color components. However the Gamma Correction block instantiated three times since processing for color components should be done in parallel. The gamma transform is also available for changing the contrast of the luminance component only.

The required Gamma correction slope for a specific display should by provided by the display manufacture. This information can be provided in various forms, as graph or formula. The gamma correction input pixel level (Gin) should be normalized to a maximum of 383. The gamma correction output pixel level (Gout) should be normalized to a maximum of 255. Then a following data should be collected:

Table 37-28. Gamma correction values

Gin	Gout
0	Gout0
2	Gout1
4	Gout2
8	Gout3
16	Gout4
32	Gout5
64	Gout6
96	Gout7
128	Gout8
160	Gout9
192	Gout10
224	Gout11
256	Gout12

Table continues on the next page...

Table 37-28. Gamma correction values (continued)

Gin	Gout
288	Gout13
320	Gout14
352	Gout15

Based on the table above the values of DP_GAMMA_S_SYNC<i> and DP_GAMMA_C_SYNC<i> fields for gamma correction control registers are calculated as following:

Table 37-29. Gamma correction values

i	DP_GAMMA_C_SYNC<i>	DP_GAMMA_S_SYNC<i>
0	Gout0	16*(Gout1-Gout0)
1	2*Gout1-Gout2	16*(Gout2-Gout1)
2	2*Gout2-Gout3	8*(Gout3-Gout2)
3	2*Gout3-Gout4	4*(Gout4-Gout3)

5	Gout5	Gout6-Gout5
6	Gout6	Gout7-Gout6
7	Gout7	Gout8-Gout7
8	Gout8	Gout9-Gout8
9	Gout9	Gout10-Gout9
10	Gout10	Gout11-Gout10
11	Gout11	Gout12-Gout11
12	Gout12	Gout13-Gout12
13	Gout13	Gout14-Gout13
14	Gout14	Gout15-Gout14
15	Gout15	255-Gout15

37.4.9.7 DC interface

The DC interface unit performs 2 tasks.

- Starts the flow via the DP by getting a request from the DC and once the DP is ready send the new frame request to the IDMAC.
- Control the DP's output FIFO and send the data to the DC using an handshake mechanism.

37.4.9.8 DP's flows management

The DP can manage up to 3 flows: one synchronous flow and 2 asynchronous flows. However the DP can handle only one flow simultaneously. The DP has an automatic mechanism to control and switch between flows.

The DP's highest priority flow is the sync flow. An async flow can be executed during the blanking interval of the sync flow. An async flow can be stopped in order to serve the sync flow. The sync flow cannot be broken. The DP holds 3 sets of registers, one set for each flow. The registers are located in the SRM memory. According to the flow that needs to be executed the correct set of registers is loaded to the DP.

The figure below illustrates the flow management done by the DP.

A flow starts when a request from the DC arrives and the internal pipe is empty. For sync flows, the full frame NF (new frame) indication arrives immediately. In case that a partial frame is also used the NF indication will be sent one row before the row that the partial plane is actually positioned.

In case of ASYNC flow the DP first check if the previous async flow was broken. If yes, the DP restores the last settings of the previous flow. If this is a new async flow the DP will first reload the flow's parameters from the SRM. In case that a partial frame is also used the NF indication will be sent one row before the row that the partial plane is actually positioned.

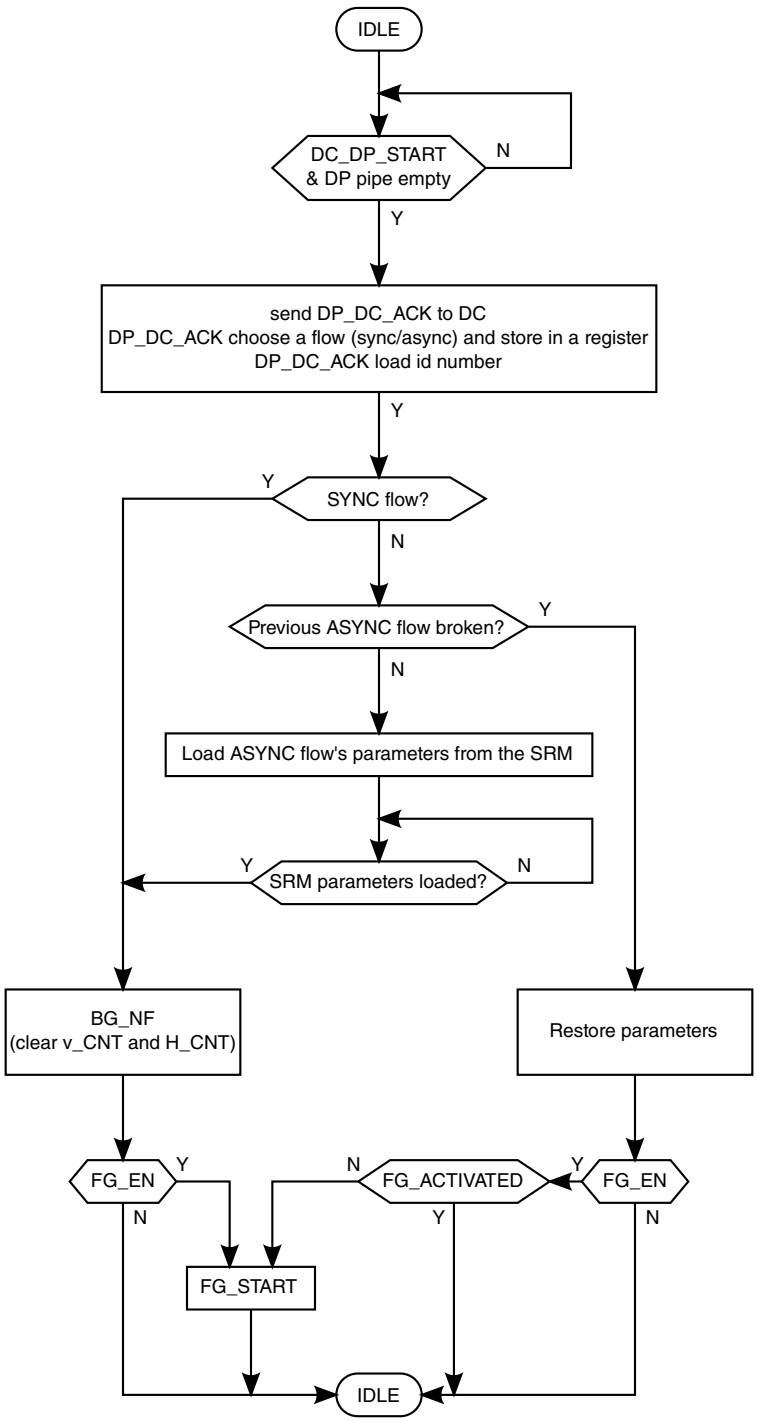

Figure 37-38. DP flow management chart

37.4.9.9 DP debug unit

The DP supports synchronous and asynchronous flows using the same hardware. The asynchronous flow can be broken by the synchronous flow. The DP's debug unit provides the ability to know on which row exactly the async flow has been broken. This is done by providing an interrupt (with DP_DEBUG_CNT register) and providing row status flags (on DP_DEBUG_STAT register).

As the async flow can broken multiple times within a specific frame The user can control the breaking point the issues the debug event by programming BRAKE_CNT field.

37.4.9.10 Restriction

When both full and partial planes are processed, the full plane's minimal frame width is 13 pixels.

The Minimum frame height supported by the DP is 2 lines.

37.4.10 Display Interface (DI)

The DI provides arbitrates access to up to three displays with time multiplexing. It converts a data from the DC or the ARM platform (low level access for serial interface only) to a format suitable for the specific display interface.

The DI generates display clocks and other display control signals with programmable timings. The DI outputs data to or inputs from parallel and/or serial interfaces.

This block generates all the control signals sent to the display. The DC sends to the DI; the data for the display and a set of control signals. The controls coming from the DC are used in order to generate the control signals sent to the display. One exception is serial low level access (LLA), where the DC is bypassed and the data is coming directly from the ARM platform. The figure below is the DI's block diagram.

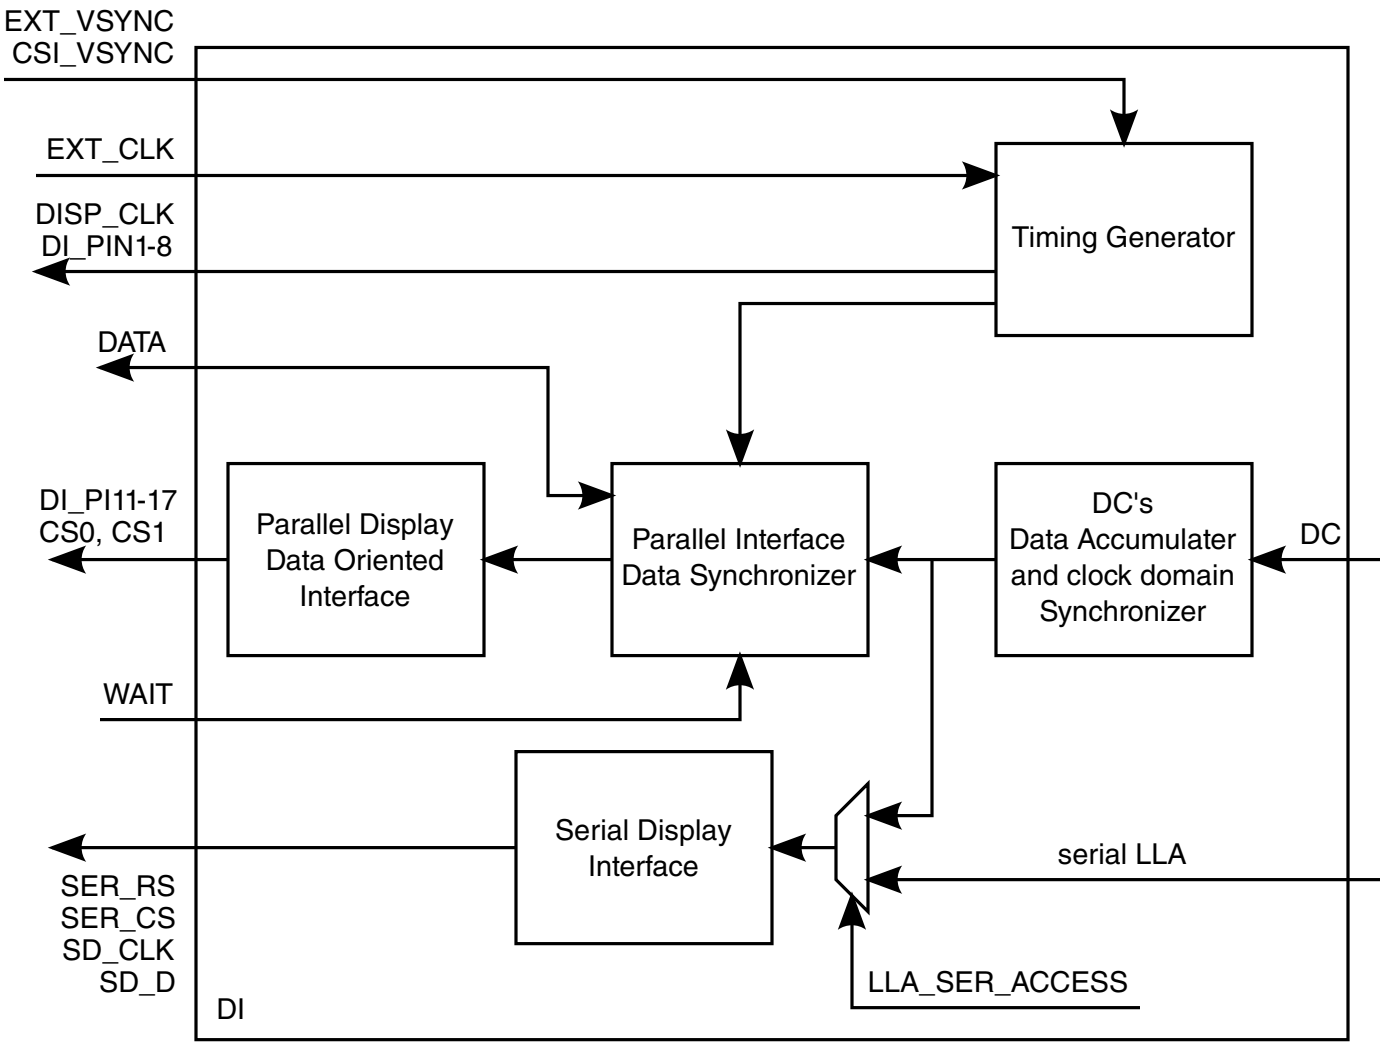

Figure 37-39. DI's block diagram

NOTE

The Serial Display Interface is not supported on this product.

The display interface includes 2 groups of control signals:

- Time oriented signals - These type of signals are generated according to the DI's internal timers. These are free running signals that change their state according to a pre-defined waveform. For example VSYNC, HSYNC, display's clock (pixel clock) etc.
- Data oriented signals - The DC may add markers to data sent to the DI. These markers are used to indicate a specific attribute of the data (for example: end-of-line, end-of-frame, chip-select etc.). The marker coming from the DC triggers a specific waveform of one or more signals on the display's interface. The specific waveform will be seen on the bus along with the associated data. The markers may be synced to

a time oriented signal. For example: attach the end-of-frame signal to the next VSYNC.

37.4.10.1 DC interface, data accumulator and clock domain synchronizer

The data accumulator is the DI's input buffer. It receives the data from the DC along with a set of control signals. The data accumulator receives the data from the DC's clock domain and synchronize it to the DI's clock domain.

37.4.10.2 Parallel interface data synchronizer and data oriented interface

The data accumulated in the DI's input buffer will be sent to the display according to the DI's internal events. Each event is generated by a counter. A tag is attached to each data by the DC's microcode using the SYNC field in the DC's microcode. The tag selects the event that the data will be synced to.

Once the corresponding event is generated, the data will be sent to the display. A data can be a pixel or a component (part of a pixel).The data synchronization occurs separately for each component. For asynchronous displays the tag will be equal to 0 i.e. the data is not synchronized to any event. The data will be sent out of the buffer immediately.

37.4.10.3 Timing generator

The timing generator is used for generating the waveforms' of each pin of the display's interface.

The timing generator is built of 10 counters. One counter functions as a time base This timer is called the BASE TIMER (BS). The other 9 counters are used in order to generate the control signals' waveforms. The last counter (counter #9) is special see Counter number 9.

The DI clock can be derived from IPU's clock (HSP_CLK) or from an external source (via the DIn_DISP_CLK - ipp_di_#_ext_clk pin). The clock's source is statically selected by configuring the DI#_CLK_EXT bit.

Figure 37-41 illustrates the main parameters of a waveform. A waveform's segment is built of 5 parameters. Each segment can be has 2 phase "ACTIVE PHASE" and "OFFSET PHASE".

- TIMEBASE - this is the base timer (fundamental timebase); all the other parameters are derived from this timer. The timebase is generated by counting DI clock cycles. The amount of cycles is defined according to DI#_DISP_CLK_PERIOD. This field defines the Display interface clock period, This parameter contains an integer part (bits 11:4) and a fractional part (bits 3:0). It defines a fractional division ratio of the Di's source clock for generation of the display's interface clock. The timebase is generated from edge aligned pulses of the DI clock. The user can delay the timebase starting point by defining an offset to the timebase. This is done by configuring the DI#_DISP_CLK_OFFSET field. The offset is calculated from the point where the DI is enabled to the point where the timebase starts ticking. The display clock waveform is generated between 2 edges of the timebase. The waveform is defined according to the DI#_DISP_CLK_UP and DI#_DISP_CLK_DOWN. Each pin has a specific timebase that is derived from the fundamental timebase. The following figure illustrates the relations between the TIMEBASE and the DI's clock

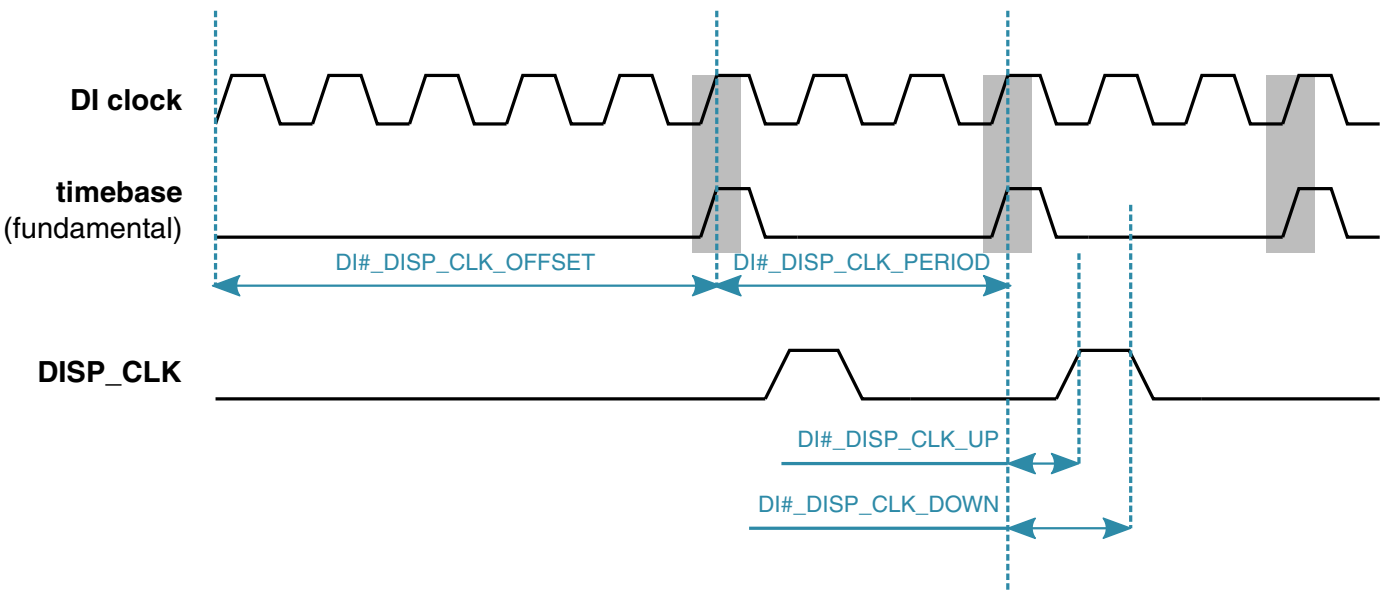

Figure 37-40. Timebase, DI's clock and display's clock relations

- OFFSET - this parameter defines when the length of the "OFFSET PHASE" it is defined by di#_offset_value_<N> field, where N is the counter's index.
- STEP - This parameter defines the length of the "ACTIVE PHASE"; it is defined by the di#_step_repeat_<N> field, where N is the counter's index. If the counter is in auto reload mode (di#_cnt_auto_reload_<N> bit is set) then the counter will be automatically reloaded forever. The value of di#_step_repeat_<N> is ignored in that case.

- RUN - The "ACTIVE PHASE" is partitioned to several "RUN sections"; this parameter defines the length of the "RUN section"; it is defined by the di#_run_value_m1_<N> field, where N is the counter's index.
- UP - Each "RUN section" contains the waveform of a single pulse. This parameter defines the offset from the beginning of the "RUN section" to the assertion of the signal; it is defined by the di#_cnt_up_<N> field, where N is the counter's index.
- DOWN - This parameter defines the offset from the beginning of the "RUN section" to the negation of the signal; it is defined by the di#_cnt_down_<N> field, where N is the counter's index. In case where DOWN < UP the waveform will have a 50% duty cycle.

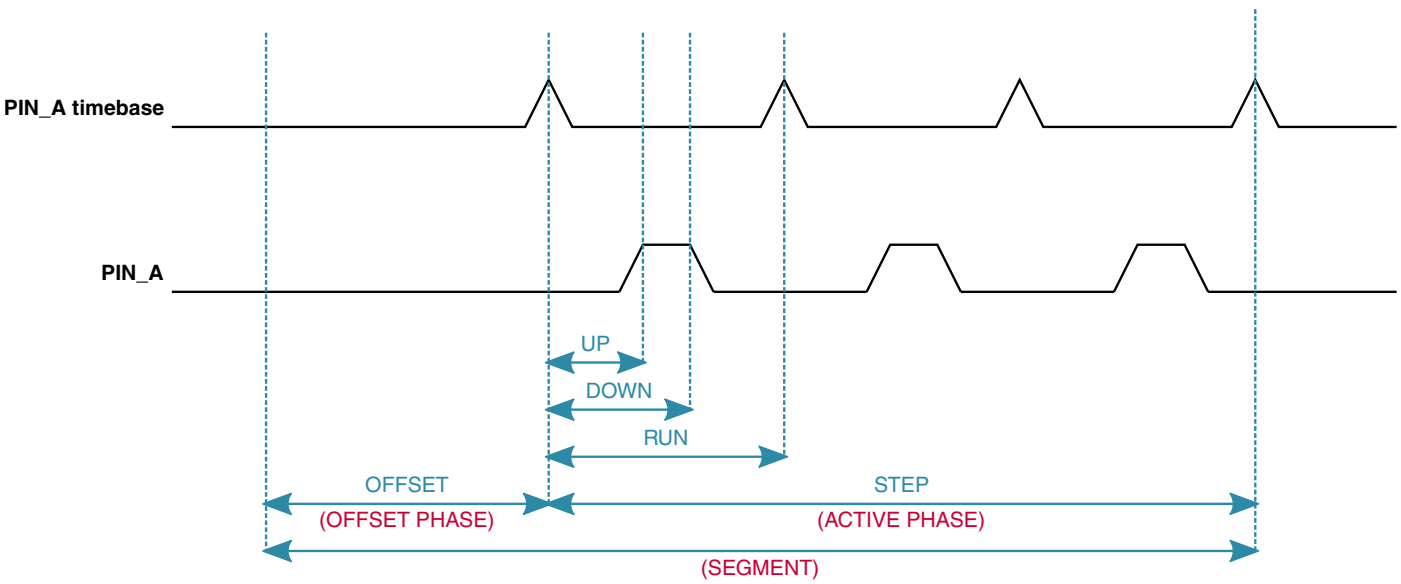

Figure 37-41. DI waveform's main parameters

37.4.10.3.1 Waveform concatenation

The DI provides the ability to derive the waveform from the fundamental timebase or from another PIN. In that case, one pin's waveform is used as another pin's timebase.

The following figure provides an example. PIN_A and PIN_C are derived from the fundamental timebase. However, PIN_B is derived from PIN_A's wavefore. The trigger is selected by DI#_RUN_RESOLUTION_<N>, where <N> is the index of the counter. A counter can be triggered by a counter with lowered index. For example: counter #5 can be triggered by counter #3 but can't be triggered by counter #7.

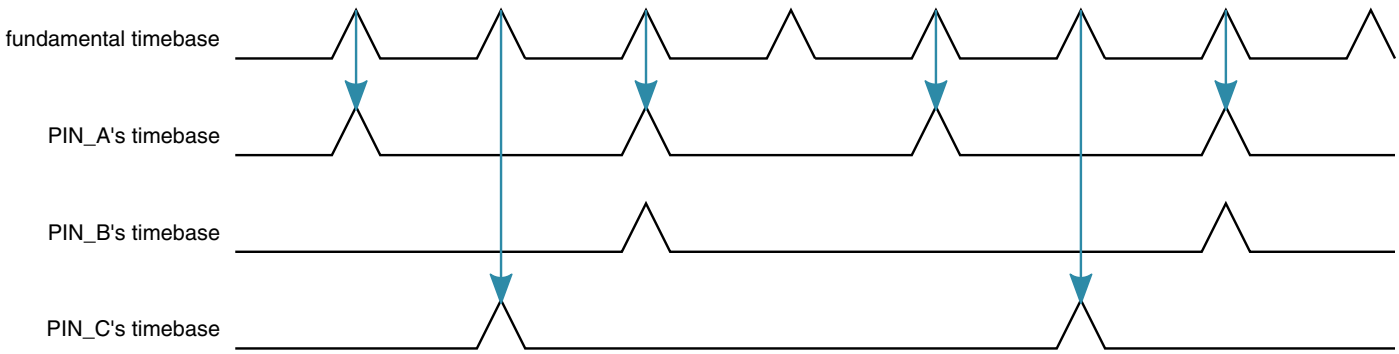

Figure 37-42. DI pins - Waveform's time bases concatenation

37.4.10.3.2 The basic counter

The DI has 9 counters. A counter is built of 3 units: timebase generator, waveform generator and polarity generator.

Figure 37-43 illustrates the counter's structure.

The timebase generator

The timebase generator gets 3 triggers. Clear, offset and run trigger. The Clear is the trigger that resets the counter. It is selected by programming the DI#_CNT_CLR_SEL_<N>.

The Offset trigger is the trigger used for counting the OFFSET_PHASE. The user can select the source of the trigger by programming the DI#_OFFSET_RESOLUTION_<N>. The offset's value is defined by programming the DI#_OFFSET_VALUE_<N>

The RUN trigger is the trigger used for counting the RUN period. The user can select the source of the trigger by programming the DI#_RUN_RESOLUTION_<N>. The RUN's value is defined by programming the DI#_RUN_VALUE_<N>

The timebase generator counts according to the DI_CLK or according to another counter's output. In order to use a source different than DI_CLK, the user should set the POLARITY_GEN_EN bits to 01.

Waveform generator

This unit generates the waveform. It gets the values of RUN, UP, DOWN and STEP and build the waveform accordingly. The waveform is counted according to the signal generated by the timebase generator.

Polarity generator

The waveform's polarity is controlled by 2 units. The static polarity is changed according to the POLARITY_<#> bit of each pin. This bit defines if the waveform of the pin is active high or active low.

The other unit controlling the polarity is the polarity generator. This unit is enabled by setting the POLARITY_GEN_EN[1] to 1. The polarity generator has 2 modes: "toggle mode" and "normal polarity mode". The mode is defined according to POLARITY_GEN_EN[0].

- Normal polarity mode - In this mode the polarity is changed according to 2 other counters. The counter selected by POLARITY_TRIGGER_SEL define the sampling point. The counter selected by POLARITY_CLR_SEL defines the polarity value. At the sampling point the polarity value is defined. The current polarity value defines the current polarity of the waveform.
- Toggle mode - In this mode, the output of the timebase generator's output causes the polarity to toggle. Any tick of the timebase generator inverts the polarity. When this mode is enabled the ticks generated by the counter selected by POLARITY_TRIGGER_SEL initialize the polarity generator and the timebase generator causes the polarity to toggle.

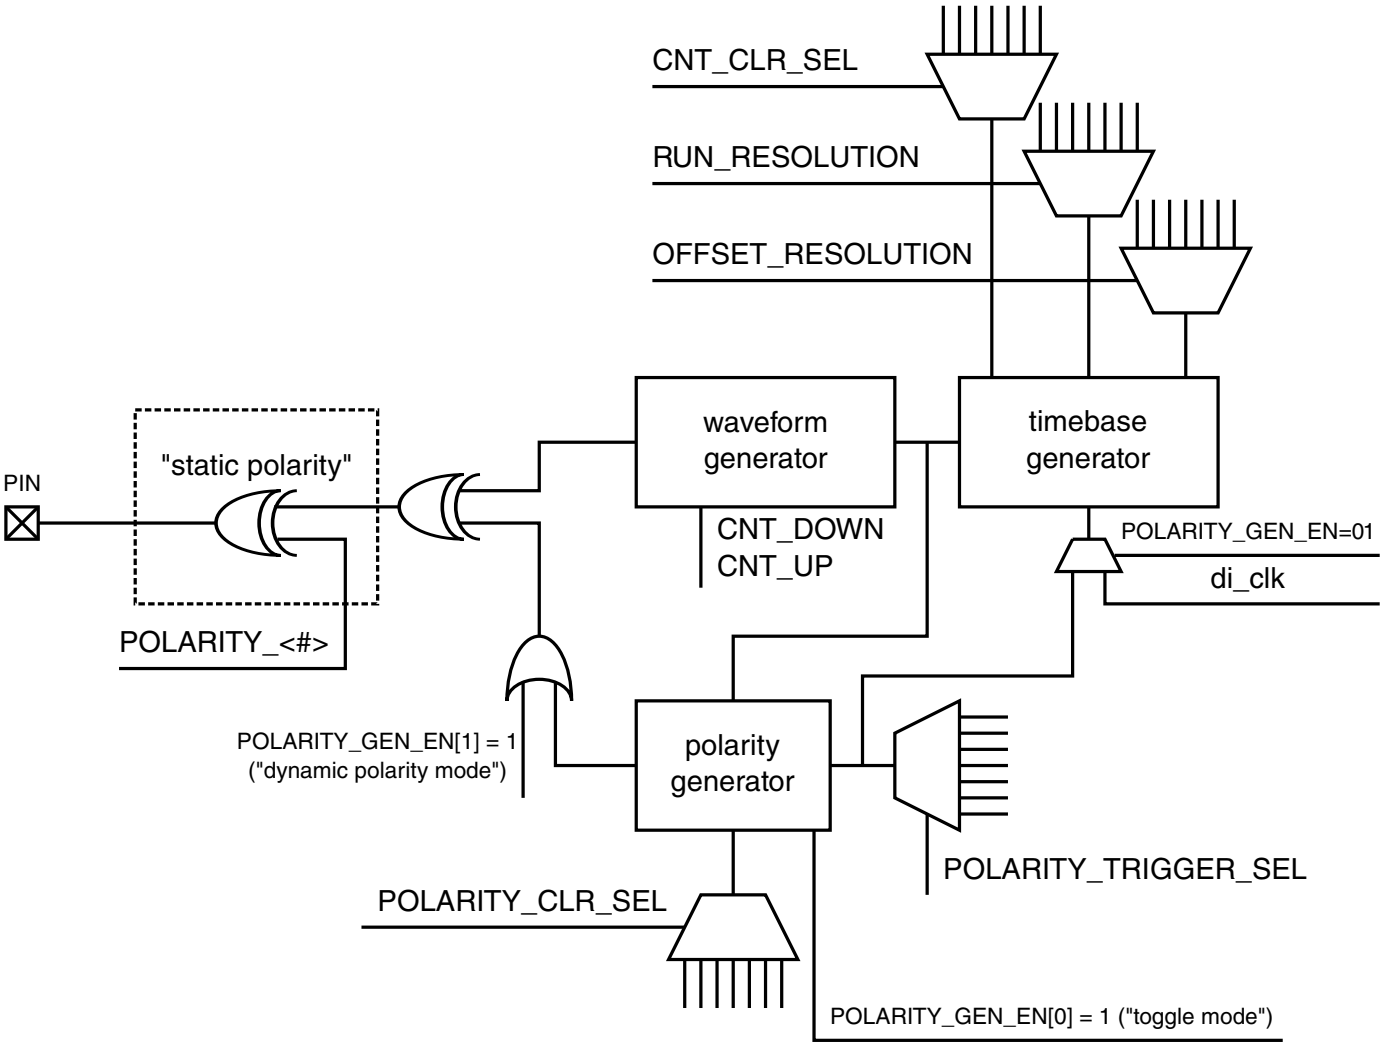

Figure 37-43. DI's counter's structure

The following figure provides an example for waveform generation using different trigger sources. The waveform is generated for PIN_D. PIN_D counter is cleared by the PIN_C's timebase. The offset period is calculated by counting cycles of PIN_B's timebase. The RUN period is calculated by counting cycles of PIN_A's timebase. The UP and DOWN periods of the waveform are calculated by counting cycles of PIN_D's timebase.

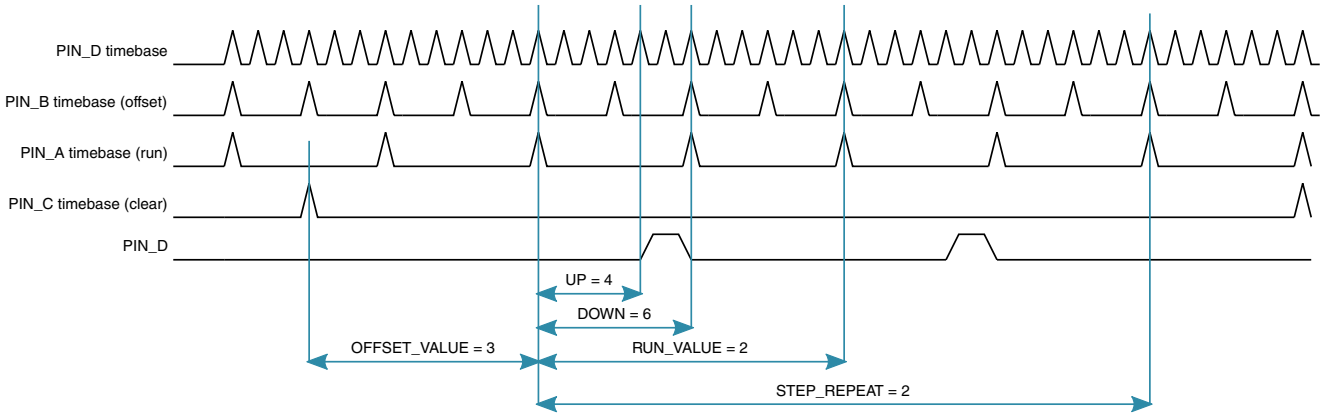

Figure 37-44. Clear, offset and run triggers and values - Example

37.4.10.3.3 Counter number 9

The last counter (counter #9) is an auxiliary counter and it is not used for generating a waveform for a specific pin. It can be used in order to attach another waveform to an existing one.

The user define the waveform for a specific pin (main pin). The user defines the auxiliary waveform using counter #9. The 2 waveforms are logically ORed. The combined waveform will be routed to the main pin. The main waveform that this counter is attached to is defined according to DI#_GENTIME_SEL_9.

The tag of counter #9 can be generated from counter #9 or from the main waveform. This is selected according to the DI#_TAG_SEL_9.

37.4.10.3.4 DI's active window

The DI provides an alternative way to define the synchronous display setting by using an active window and thus, needs to program less counters. The synchronous display's active window is a rectangle on the display where IPU sends data. It is set by programming the parameters defined on DI#_AW0 and DI#_AW1 registers.

The following figure illustrates the different parameters defining the active window. The display's vertical and horizontal position are defined according to counters. The DI#_AW_HCOUNT_SEL selects the counter which the horizontal position is calculated according to. DI#_AW_VCOUNT_SEL selects the counter which the vertical position is calculated according to. The Active data is sent according to a trigger. DI#_AW_TRIG_SEL selects the counter which calculates this trigger. This trigger usually functions as a data enable signal.

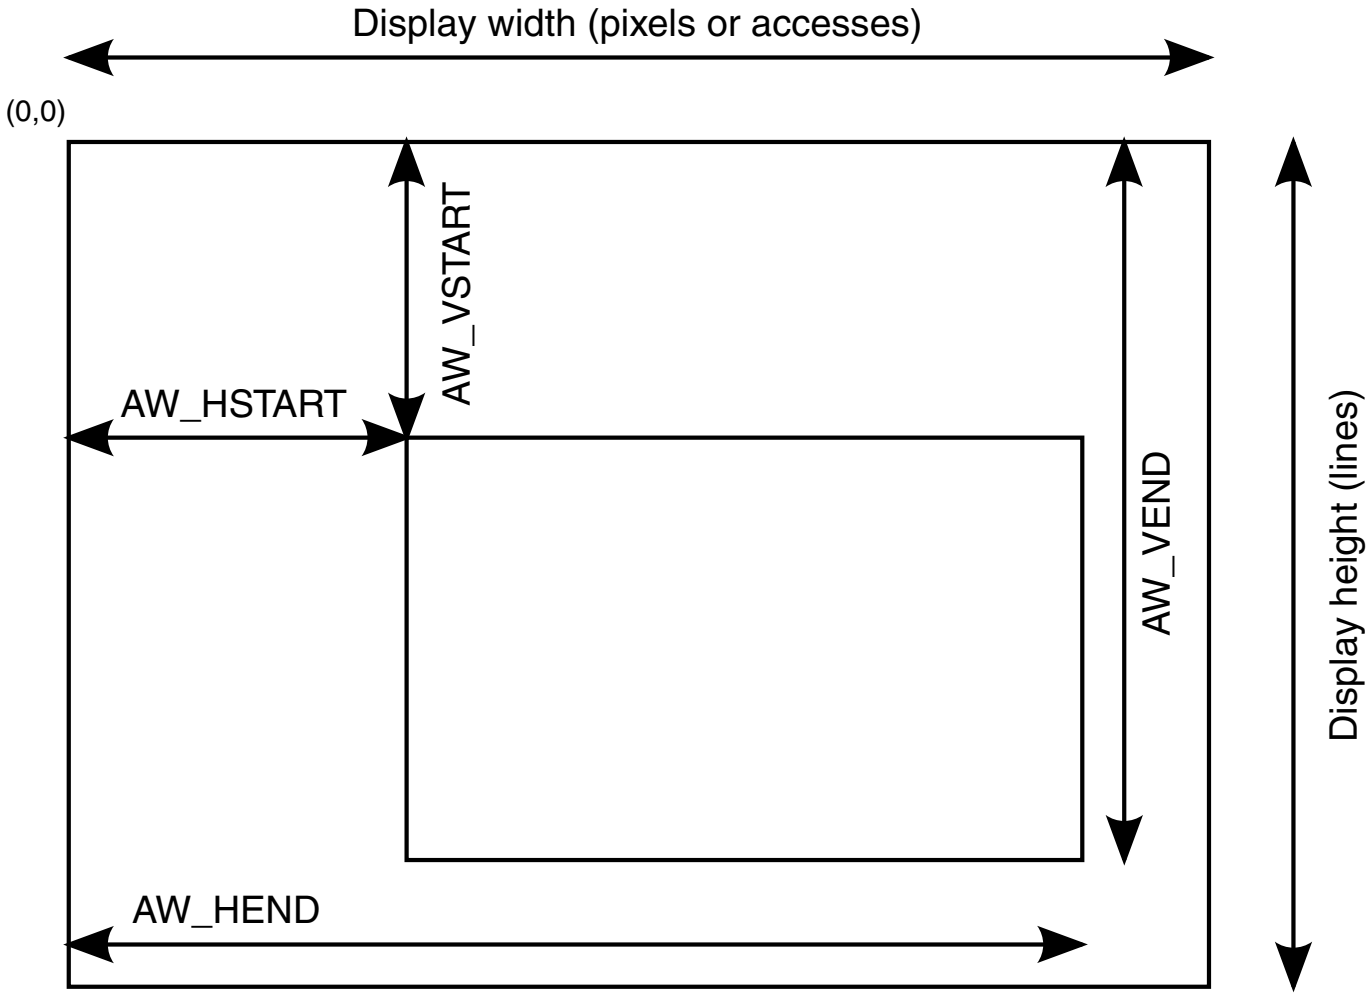

Figure 37-45. DI's Active Window

37.4.10.4 Waveform settings for asynchronous interface pins

The DI provides 8 signals that are used for asynchronous interface. These signals are PIN11 through PIN17 (ipp_di_#_pin_11 through ipp_di_0_pin_17) and the CS (ipp_di_0_do_dispb_d0_cs).

The DI holds 12 wave set quartets. Each quartet includes 4 registers (DI#_DW_SET<j>_<i>). Each DW_SET register holds the UP and DOWN values of the waveform. The DW_SET register is selected in the following way. The WAVEFORM field in the DC template is a pointer that points to one of the 12 quartets. In addition the WAVEFORM field points to one of 12 DI#_DW_GEN_<i> registers. The DI#_DW_GEN_<i> holds 9 pointers. The pointers are 2 bits field that points to one of the registers from the DI#_DW_SET<j>_<i> quartet. Each one of the 8 pointers in the

DI#_DW_GEN_<i> registers is related to a specific pin of the DI's asynchronous interface. The following figure illustrates the relations between the registers controlling the asynchronous interface's signals.

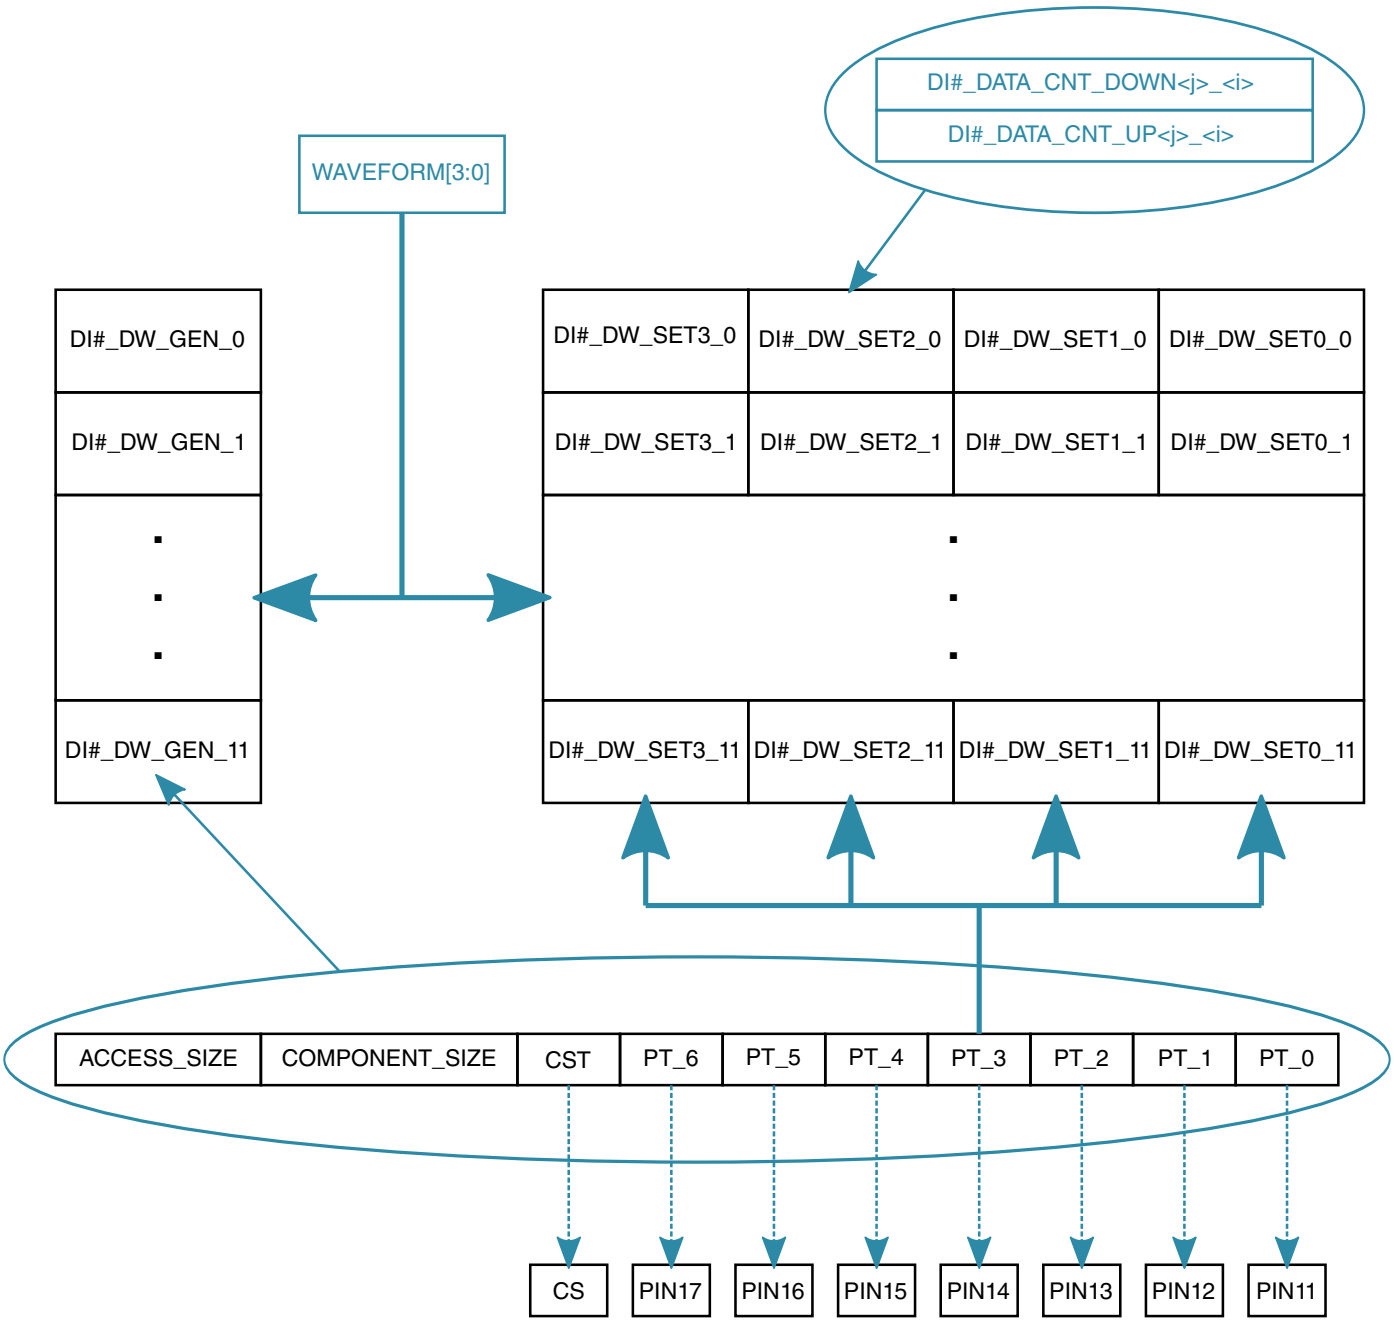

Figure 37-46. Waveform settings for asynchronous interface pins - parallel interface

The DI#_DW_GEN_<i> register includes the data's waveform settings as well. ACCESS_SIZE defines the amount of DI clock cycles that a pixel is valid on the bus. When generic data is sent, this field defines the amount of cycles that the generic data is

valid on the bus. A pixel may be broken into few components. The COMPONNENT_SIZE field defines the amount of cycles that each component is valid on the bus.

The COMPONNENT_SIZE is always smaller or equal to ACCESS_SIZE. For synchronous interface COMPONNENT_SIZE is always equal to ACCESS_SIZE. In case that there's a need for some gap between one type of accesses to another having the COMPONNENT_SIZE smaller than ACCESS_SIZE can be useful (for example read after write accesses that require some gap between them).

37.4.10.5 Low Level Access - LLA

LLA is a ARM platform direct access to the display. For parallel displays the DI's behavior for LLA is the same as any other access to a parallel display. For serial displays the DI allows a DI arbitration bypass. This is done if the DI#_LLA_SER_ACCESS bit is set.

In that case there is a direct access from the DMFC to the DI which bypasses the DC allowing simultaneous access to both serial and parallel interfaces. When DI#_LLA_SER_ACCESS bit is set, the user must not do any other kind of accesses to the serial interface except LLA. When DI#_LLA_SER_ACCESS bit is set the corresponding DI#_WAIT4SERIAL must be clear.

37.4.10.6 Using a mask channel

The IPU is able to provide the windowing function on displays that have data enable control. This is achieved by masking of some screen regions according to a 1-bit/pixel mask read from the memory via IDMAC through channel #44.

When the mask value is zero, the pixel is not displayed. This feature can be used for dual-port smart displays.

37.4.11 Video De Interlacing or Combining Block (VDIC)

The Video De-Interlacer as well as the Combiner have two operation modes:

- De-interlacing: converts an interlaced video stream to progressive order.
- Combining: combines two video/graphics planes and a background color.

The Video De-interlace block (VDIC) deinterlaces standard interlaced video to produce progressive video, that is used for upsizing to HD formats or for display on progressive displays. For VDIC operation three fields are necessary F(n-1),F(n),F(n+1). The F(n-1) field arrived through CSI interface in real time mode or through channel 1 and then stored in FIFO1. The F(n) arrived through channel 2. At least three lines of F(n) are stored in Line Store memory. The F(n+1) arrived through channel 3 and stored in FIFO3. FIFO controllers read data from FIFOs and then data aligned in pixels buffers. From the buffers the data arrived to Line Padding Controller (LPC). The LPC padding missing line at the beginning and end of the frame. The DeInterlacing sub-block (DI) perform the processing. Then data send to IC sub-block for processing or for transferring to external memory.

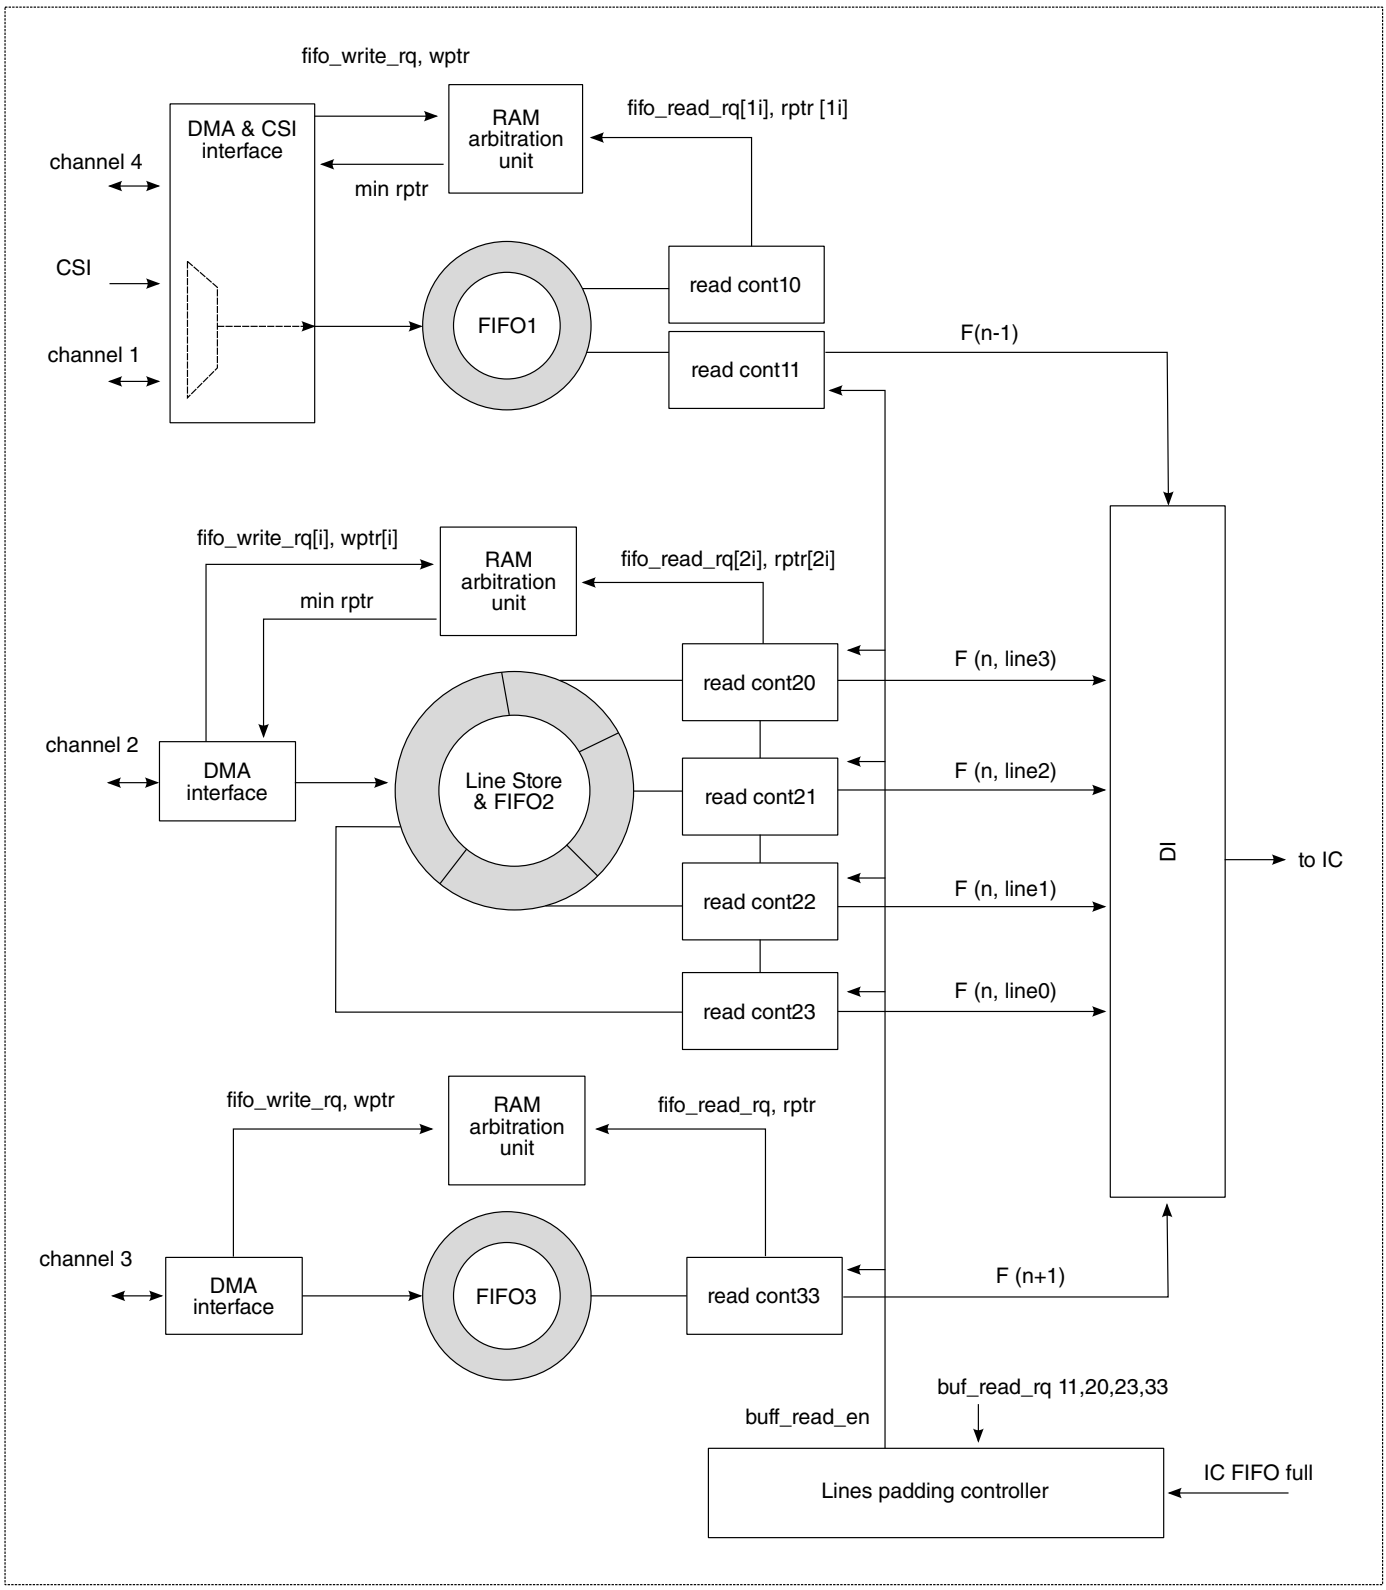

Figure 37-47. VDIC Block Diagram

37.4.11.1 VDIC Features

Key features of the VDIC block include:

- Deintarlacing
  - maximum horizontal resolution 968 pixels
  - maximum pixel rate 75100MP/s
  - Support YUV422 and YUV420 formats
- CSI FIFO mode
- Combining

37.4.11.2 De interlacer (DI) sub-block

The block diagram of the DI block is shown in figure below.

Pipelining is inserted at all stages, so that the design may run at a fast clock speed, if needed.

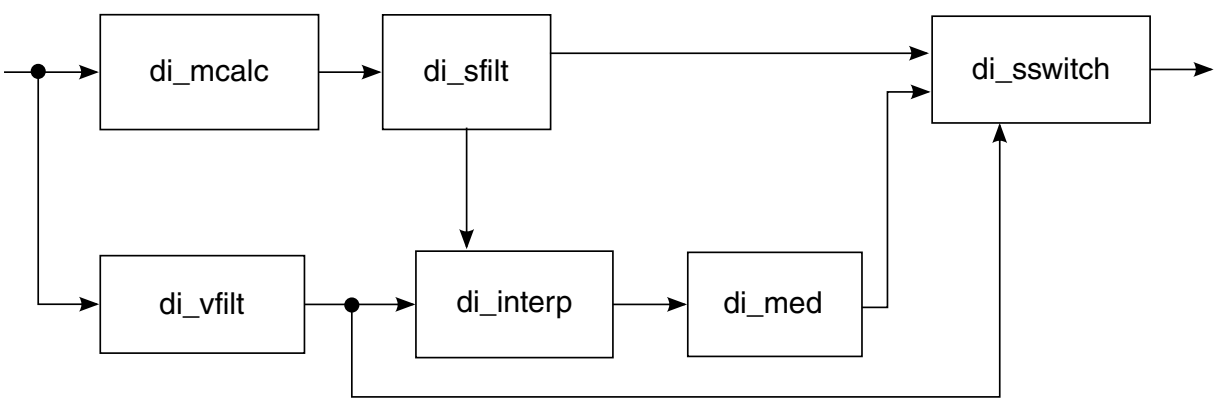

Figure 37-48. DI block diagram

37.4.11.2.1 Vertical Filter Block (di_vfilt)

The di_vfilt block performs spatial vertical filtering of pixels.

It is a four tap vertical filter:

vfilt_out = (-3.0*pix1 + 19.0*pix2 + 19.0*pix3 - 3.0*pix4)/32.0

Where pix1, pix2, pix3, pix4 are four pixels in same horizontal location on four consecutive lines of a field.

vfilt_out is pixel being predicted (between pix2 and pix3)

37.4.11.2.2 Motion Calculator Block (di_mcalc)

The mcalc block estimates the amount of motion for any given pixel by looking at pixel values in current, previous and next fields.

The generic formula used to calculate the estimated motion is:

m = SAT(Ks*(|e-w|/(|e-w|+|n-s|+SPA_DETAIL)))

- Where, n is the pixel above the pixel being predicted
- s is the pixel below the pixel being predicted
- e is the pixel in previous field at same spatial location as the pixel being predicted
- w is the pixel in next field at same spatial location as the pixel being predicted
- m is motion estimation for the pixel being predicted (range from 0 to 1)
- Ks is slope control and decides how quickly the algorithm switches from no motion (m=0) to full motion (m=1)
- SPA_DETAIL is a constant (50) that is added to |n-s|.
- SAT() is saturate at 1 function

The motion calculator block is simplified in a certain respect, by removing the need for a divider, while providing a degree of flexibility. The main motivators for this are the following observations:

1. the above equation defines a set of curves based on the value of |n-s|, but the curves are fairly closely spaced, so that using a granularity of 8 in |n-s| to define specific curves to use gives pretty much the same quality of picture as using all of the curves; and once |n-s| reaches about 120, the effect of an increased |n-s| value is hard to observe
2. once |e-w| gets to about 15, the motion is usually saturated to a value of 1

Based on the above observations, the motion calculator is now implemented with the use of two "ROM"s, using the 4 LSBs of |e-w| and bits 6:3 of |n-s|.

The motion calculator has 3 modes of operation. These modes are defined by the VDI_MOT_SEL field. In case that the user has an information about the motion (For example SW analyzing motion vectors provided by a video decoder) he can select one of the modes listed below. Changing the value of the VDI_MOT_SEL has an affect only on the next frame.

- When VDI_MOT_SEL==2'b01, m_calc is 0 (no motion - use weave)

- When VDI_MOT_SEL==2'b10, We assume high motion and use min(15,delta_t).
- When VDI_MOT_SEL==2'b00, We assume low motion and use sat([0,15],delta_t-8) (delta_t-8 is signed operation).

37.4.11.2.3 Spatial Motion Filter (di_sfilt)

The di_sfilt block spreads motion signal over five pixels:

Mspread = MAX(m3, (0.5*m1 + m2 + m3 + m4 + 0.5*m5)/4.0)

- Where, m3 is motion estimate for current pixel
- m2 is motion estimate for previous pixel
- m4 is motion estimate for next pixel
- m1 is motion estimate for pixel before previous pixel
- m5 is motion estimate for pixel after next pixel

37.4.11.2.4 Interpolated Pixel Calculator Block (di_interp)

The di_interp block uses the motion estimated by the di_sfilt block and computes an interpolated pixel that is weighted sum of the surrounding four pixels (n, s, e, w).

The block performs the following calculations:

```
          if (Mspread <= 0.5) {
i = (1-2*Mspread)*(e+w)/2 + 2*Mspread*vfilt_out
} else {
          i = vfilt_out
}
```

Where, i is the interpolated pixel

n, s, e, w are surrounding pixels as explained earlier

37.4.11.2.5 Median Filter Block (di_med)

The di_med block performs a 5-point median of n, s, e, w and i pixels.

It should be noted that the median required here is not a true 5-point, but can be implemented more efficiently as a 3-point median:

med = MEDIAN(min(max(n,s),max(e,w)), max(min(n,s),min(e,w)), i)

37.4.11.2.6 Soft Switch Block (di_sswitch)

The final output of the deinterlacer is a blend of the median value and the vertical filter, assuming that the pixel data n,s are uncorrelated with the pixel data e,w. By uncorrelated, we mean (max(n,s) < min(e,w)) or (min(n,s) > max(e,w)).

```
          if (Mspread <= 0.5 || not(F)) {
pix_out =    med
} else { /* Mspread > 0.5 */
pix_out = (1-2*(Mspread-0.5))*med + 2*(Mspread-0.5)*vfilt_out
}
```

37.4.11.3 DMA only Mode

In DMA only mode the data is coming from IDMAC only.

37.4.11.4 Real Time Mode

In Real Time Mode the F(n-1) are coming from CSI. The CSI write to FIFO1. The DI sub-block read F(n-1) from processing. In addition IDMAC read the field from FIFO1 and store in external memory. Then stored frames are used as F(n) and F(n+1).

37.4.11.5 CSI only Mode

In CSI only mode VDIC do not perform any processing and used as FIFO only. The data arrived from CSI written to FIFO1. The IDMAC read data from the FIFO1. The FIFO3 and Line store memory are not used. The ID sub-blocks are turned OFF. The CSI only mode can be used as alternative to SMFC, when appropriate.

37.4.11.6 Using Combining in the VDIC

As an alternate function to the de interacing function, the VDIC can perform combining of two planes.

- Both planes have to be at the same color space.
- Overlaying of a single plane over a unified background is supported.
- The planes can be at a different sizes - one plane can be smaller than the other.
- Combining requires a single cycle per output pixel.
- Alpha blending (global or local) is supported.
- Color keying is supported.

The plane's location and size is programmable as shown in the following figure.

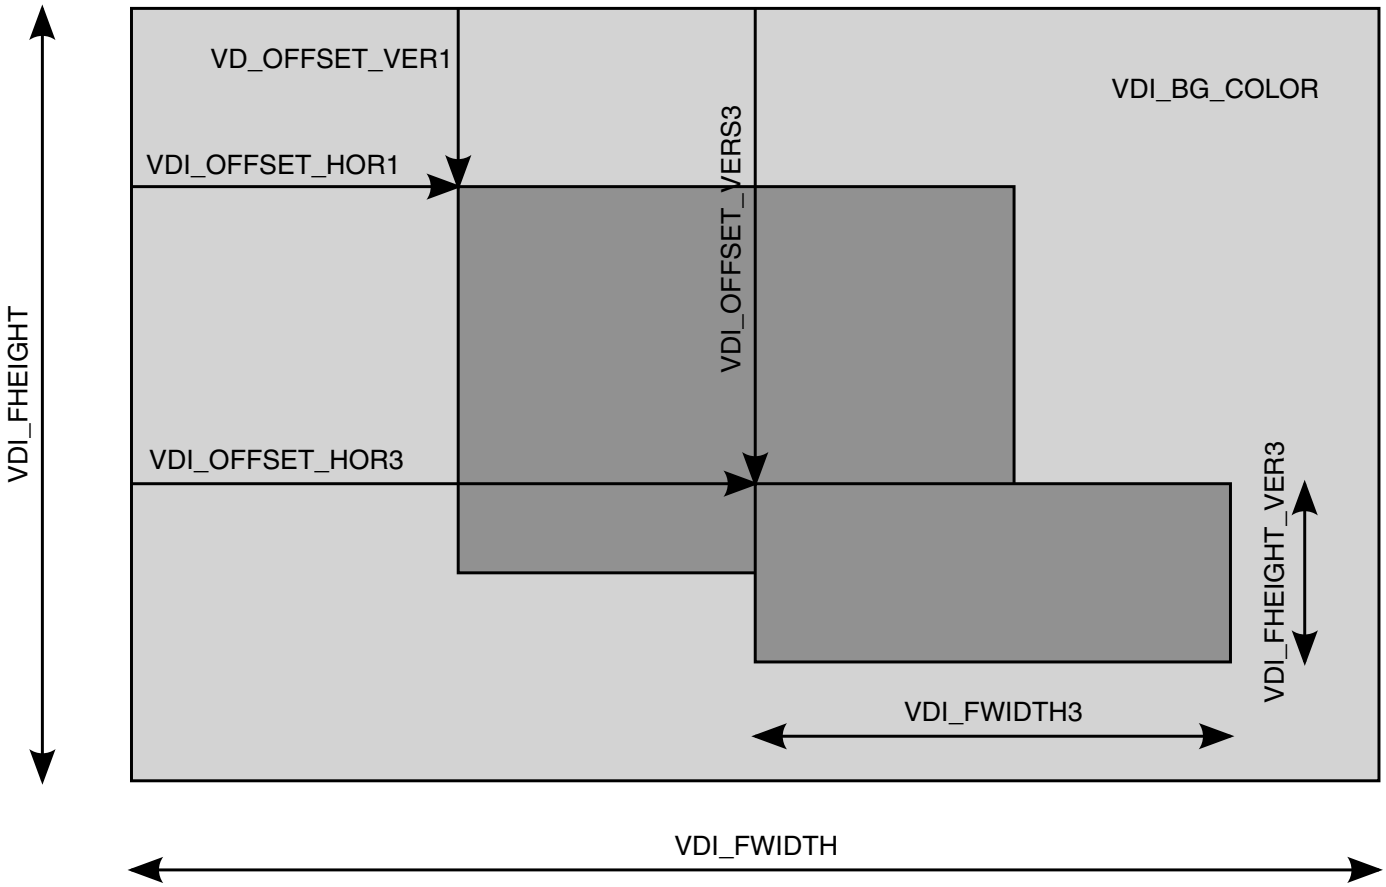

Figure 37-49. The relations between planes of the combining unit

When local alpha is used it should be arrived through channel3 of the VDIC.

The combining equation is:

OP = BG*(1 - alpha) + FG*alpha

Where "OP" is output pixel, "FG" is input pixel of foreground plan arrived thought channel3, BG is input pixel of background plan arrived thought channel1, "alpha" is global or local transparency.

37.4.11.7 VDIC Restrictions

- Maximum output pixel rate is 100 MP/s.
- The output pixel format (YUV422 or YUV420) are equal to input format.
- The VDIC can perform combining or de interlacing. It cannnot perform both functions at the same time.

37.4.12 Control Module (CM)

37.4.12.1 Block Diagram

The CM Block Diagram is shown in the figure below.

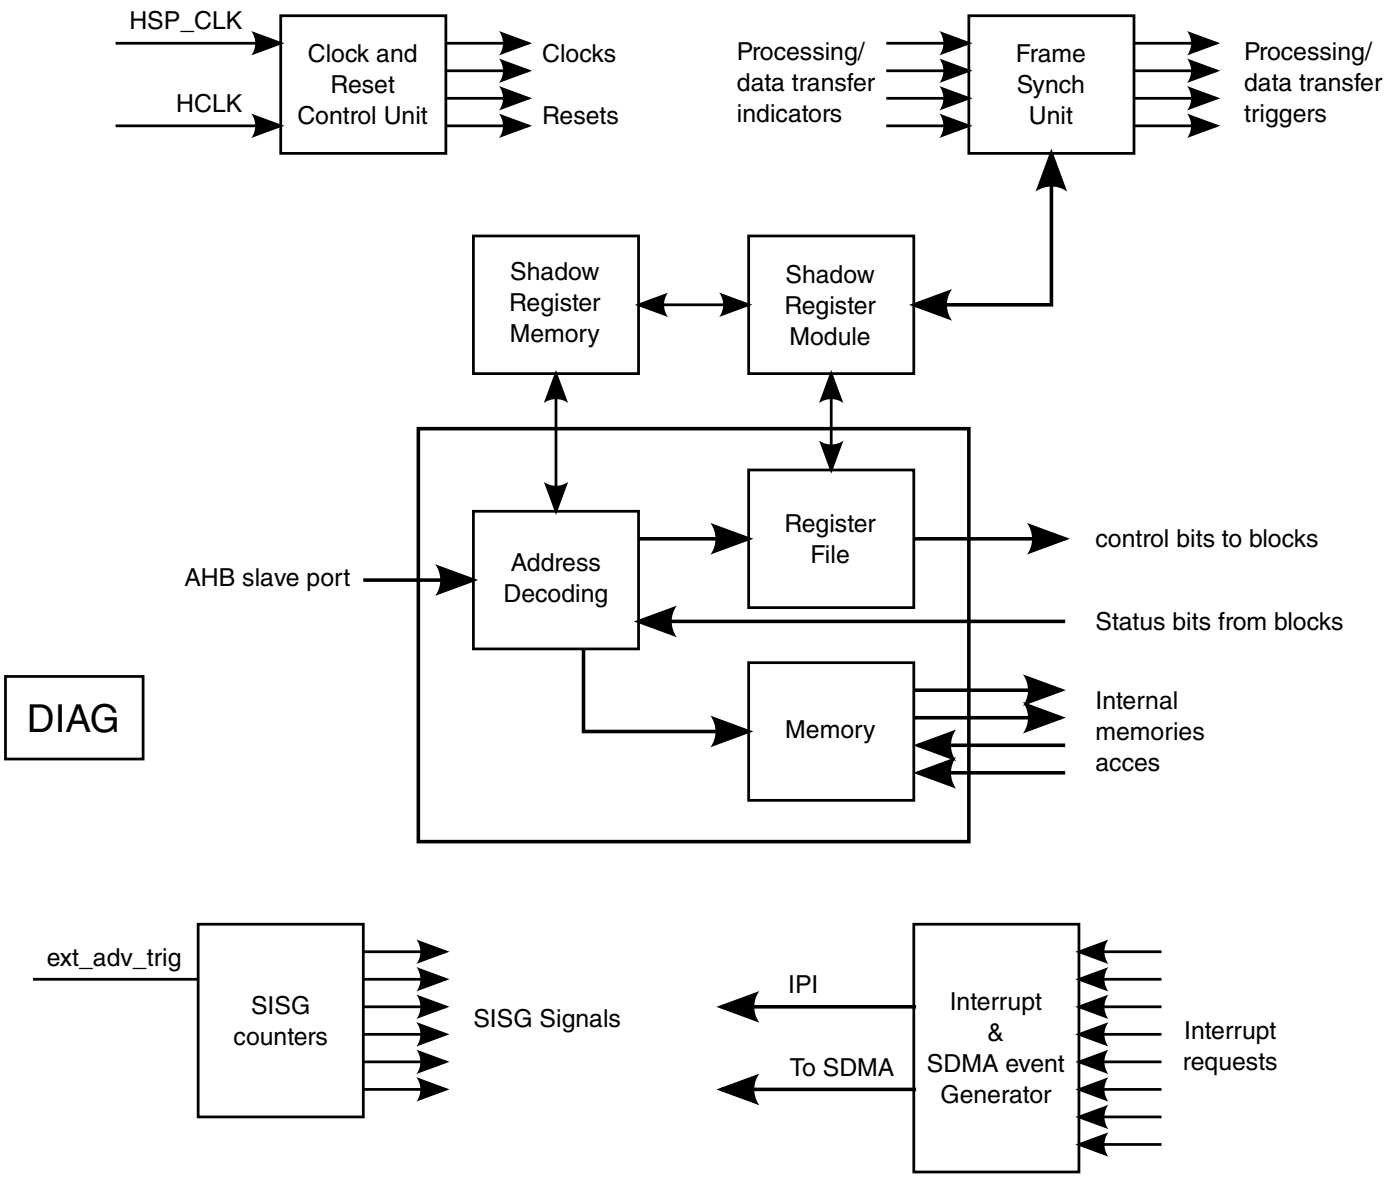

Figure 37-50. CM Block Diagram

The CM consists of the Frame Synchronization Unit (FSU), the Interrupt Generator (IG), the General Configuration Registers (GCR), the Clock and Reset Control Unit (CRCU) and the Shadow Registers Block (SRM).

37.4.12.2 Frame Synchronization Unit

This section details the frame synchronization unit.

37.4.12.2.1 General Description

The FSU provides synchronization of tasks performed by different IPU sub-blocks and ARM platform tasks. This allows to build complex processing flows which are performed automatically (without ARM platform involvement in synchronization of the IPU's tasks).

The FSU supports double buffering of image frames stored in the external memory and allows chaining IPU processing flows in automatic mode.

37.4.12.2.2 Frame Synchronization Flow

1. Initialization

   The ARM platform initializes all the parameters for a task by writing to the GCR and to the parameters memories of each IPU sub-blocks. The initialization must occur before the ARM platform enables the task.

2. Enabling

   After the initialization step has been completed, the ARM platform enables the task by setting its enable bit in an appropriate register.

3. Triggering

   After the task is enabled, the FSU waits for triggering signal. The triggering signals is a combination of the enable bit and the buffer ready signal which can be driven by the ARM platform (DMA_CH_BUF<0/1>_RDY_<#>) and/or by the preceding task (IDMAC_EOF_# or Frame Complete signal from the DC).

   The trigger causes the FSU to invoke the relevant unit to start by assertion of the NEW_FRM_RDY signal. In some cases triggering occurs at the enabling step (when the enable bit is the trigger for the task).

4. Operating

   The triggering step cause the task to move to active mode, this is the operating step. In this step, the FSU monitors the synchronization signals from ARM platform, IDMAC and the corresponding processing units, and controls the units operation. The FSU also controls the IDMAC buffer toggling when double buffer page flipping is used.

The FSU checks at end of each frame if the next frame can be served. If the answer is yes, the FSU stays in active mode with re-sending the <TASK>_NEW_FRM_RDY signal and updating the relevant flags (e.g. DMA<BL>_<#>_CUR_BUF and DMA<BL>_<#>_BUF_RDY). If the answer is no, the FSU moves to pause mode and pauses the task waiting until the next frame can be served.

5. Disabling

   When the task is disabled by the ARM platform (by negating the enable bit), it moves back to non-active mode.

37.4.12.2.3 FSU's fundamentals

Trigger source select

A flow is triggered by a trigger. The trigger may be asserted manually by the ARM platform or may be a result of the completion of the preceding task. Trigger's source select choose the source of the trigger. The trigger means that the data is ready to be processed by the sub-blocks. The trigger source select is defined by the corresponding SRC_SEL bits of the block or task.

Trigger destination select

A block or task that process data needs to know that the following task in the chain is ready to receive the processed data. The user needs to specify what is the destination of the processed data. This is done by setting the corresponding DEST_SEL bits of the block or task.

Double buffering

The IPU supports double buffering in the system's memory. When a flow is processed frame by frame the first frame will be read from one location (BUF0) in the memory, the next frame will be read from another location in the memory (BUF1). The location in the memory of the buffers is defined by the EBA0 and EBA1 parameters of the corresponding channel in the CPMEM. The IDMAC use the correct buffer according to the DMA_CH_CUR_BUF_# signal. The FSU automatically toggles the DMA_CH_CUR_BUF_# to point on the correct buffer to be used by the channel. In order to work in double buffer mode the corresponding DMA_CH_DB_MODE_SEL_# needs to be set.

Alternative flow

Some of the IPU sub-blocks can handle 2 flows via them one is the main flow and the other is the alt flow. In order to support an alternate flow via the same sub-block an alternative configuration should be used by the sub-block. This includes

- Alternate registers including an alternative sub-block's setup - this is handled by the SRM
- Alternate IDMAC settings: parameters in the CPMEM, separate alpha
- Alternate SRC_SEL as the source of the trigger may come from a different function.
- Alternate FSU settings (CUR_BUF, BUF_RDY, DB_MODE_SEL)
- Some of the display sub-blocks alternate settings are handled by programming an alternative set of registers.

The FSU handles the switch to the alternate flow, it controls the update of the alternate configuration and send the appropriate signals to other sub-blocks in the IPU indicating about a need to switch to the alternate configuration.

Once a frame is completed there is a chance that there are 2 buffers ready. One is the next buffer of the current flow and the other is the a buffer in an alternate flow. The FSU will automatically select between the next buffer to handle in a round-robin fashion.

IPU task chaining - Single flow

The diagram below illustrates task chaining in the In this example a single flow is handled

The Frames are coming from the same camera sub-block. The frames are handled frame by Frame. The first frame arriving Frame0 is stored in BUF0 of the "INPUT BUFFER". Once the Frame0 is ready in BUF0, the processing sub-block is triggered and data is read from BUF0 to the processing sub-block. In the meantime, Frame1 coming from the camera is written to BUF1 of the "INPUT BUFFER". The processing sub-block processes the data and stores the first frame on BUF0 of the "OUTPUT BUFFER". Once the processing is done and the frame is ready, the display sub-block is triggered to pick the data and send it to the display. The processing sub-block will start working on the next frame once the data is ready in the "INPUT_BUFFER" and there's a free buffer in the "OUTPUT_BUFFER".

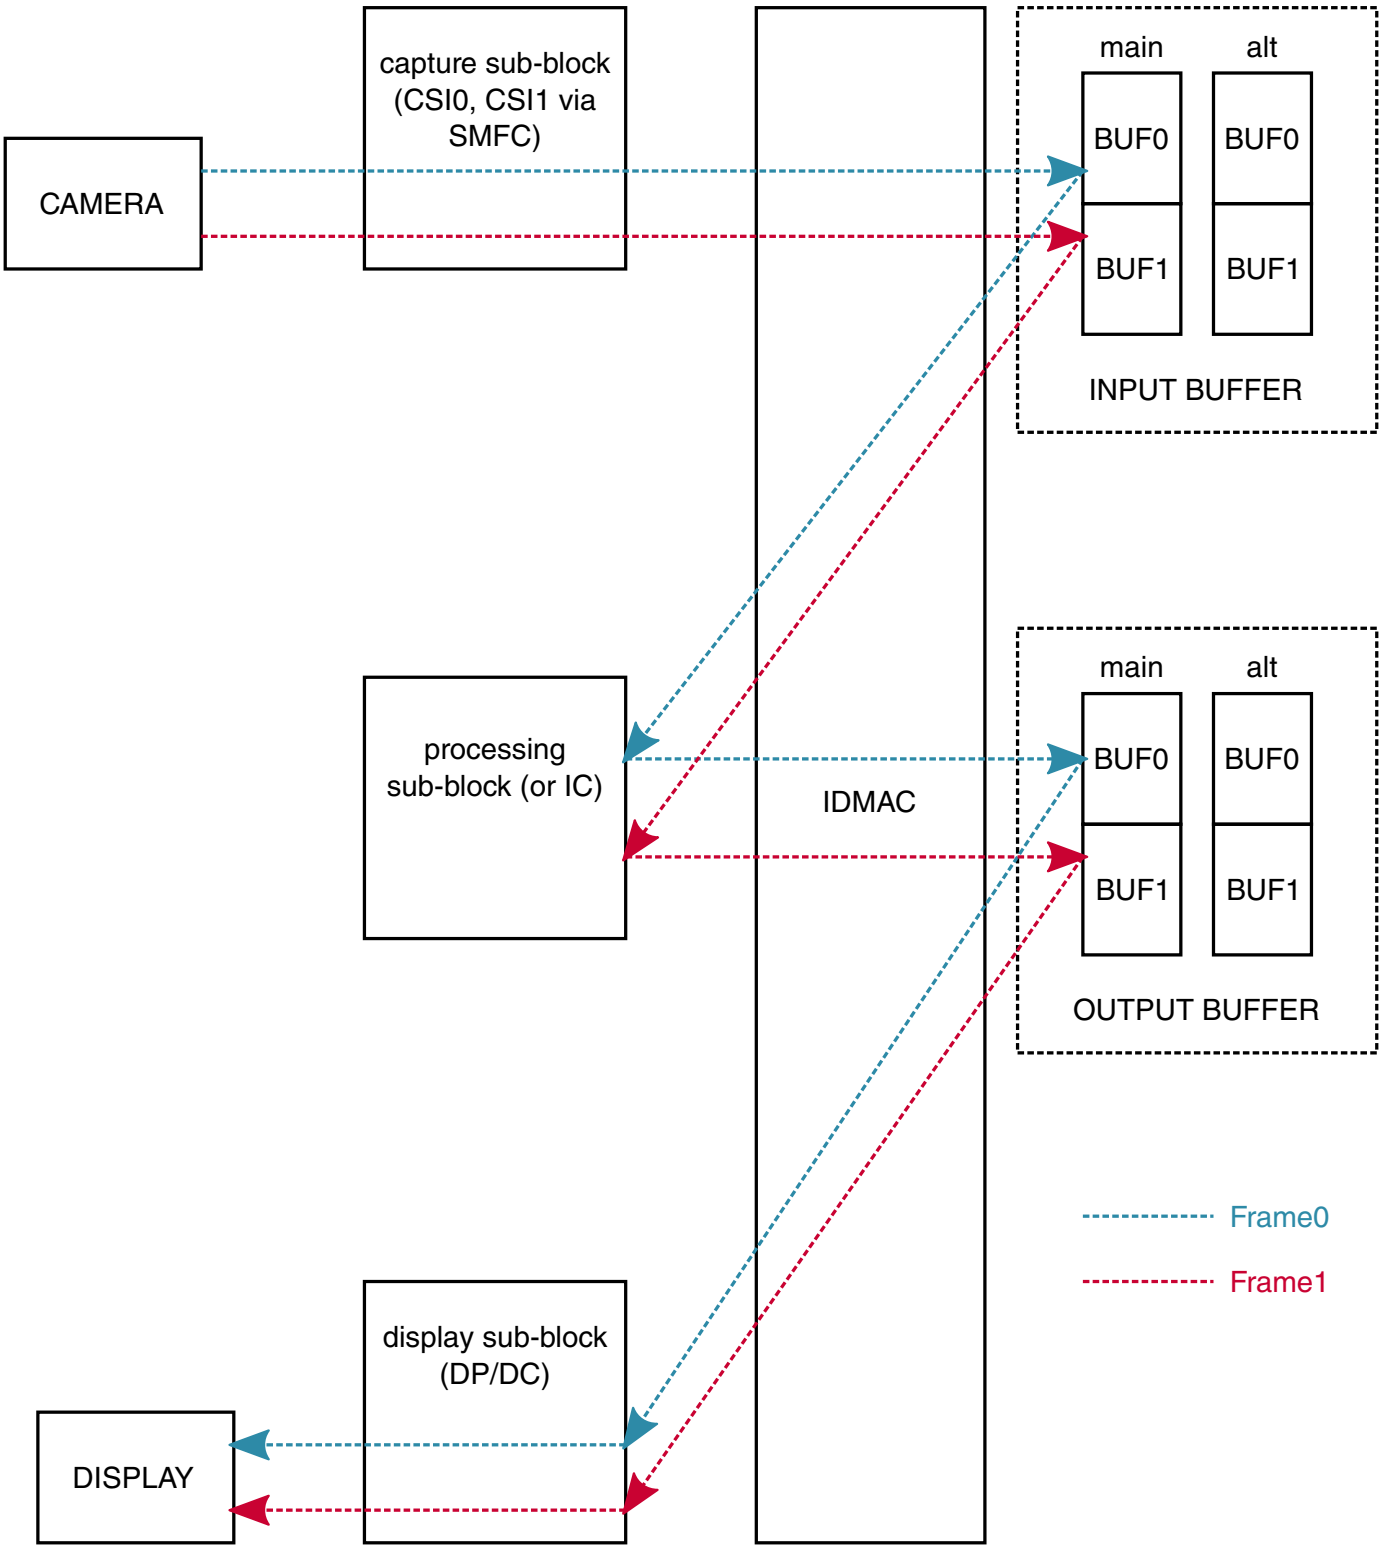

Figure 37-51. IPU tasks' chaining illustration - single flow

IPU task chaining - double flow

The diagram below illustrates task chaining in the In this example double flow is handled. In addition to the flow described on the previous example, another flow is handled via the display sub-blocks. In that case the DC will handle 2 flows. Once sending Frame0 to the display is complete, the FSU will decide in whether to handle Frame1 or Frame0_ALT. The decision is made according the readiness of the other buffers in the memory, in case of 2 ready buffers (main flow and alternate) the FSU will switch between them in a round robin fashion.

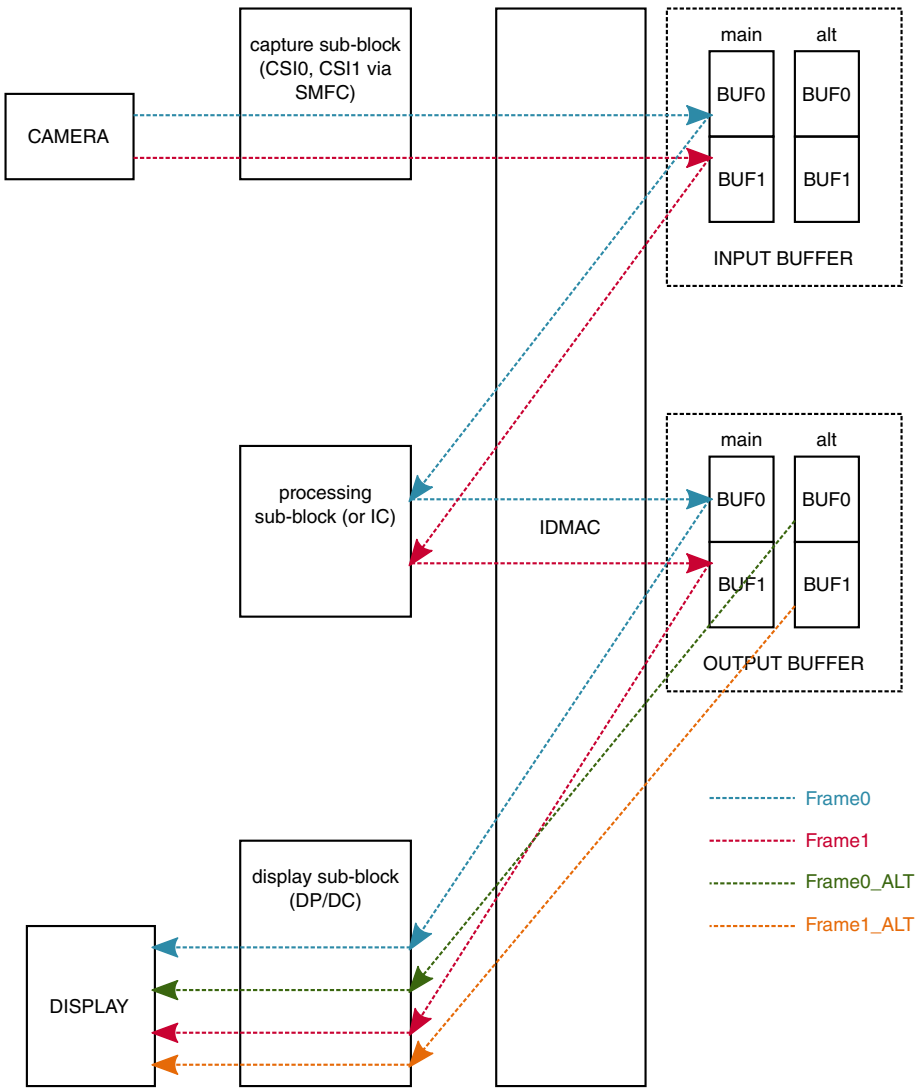

Figure 37-52. IPU tasks' chaining illustration - double flow

37.4.12.2.4 IPU main flows

IPU's flows can be partitioned into 5 groups.

- CF - capture flows

- PF - processing flows
- SF - synchronous display flows
- AF - Asynchronous display flows
- DF - Direct flow from IC to the display

Tasks from different groups can be chained as illustrated below.

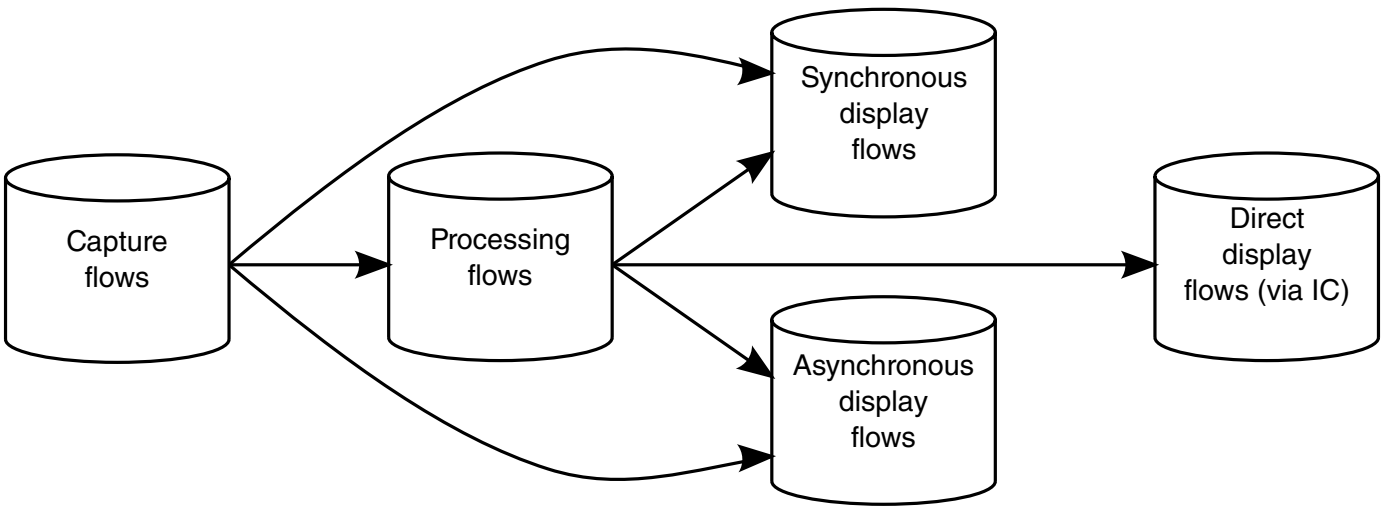

Figure 37-53. IPU task flows chaining

The tables below describe the most important use cases of chaining the IPU tasks. The tables show the main task for each group.

The physical DMA channel is the DMA channel that is used for the main flow - this is the IDMAC channel that is physically connected to the block - the CPMEM parameters should be configured according to the physical channel number. In case of an alternate flow then an alternate entry in the CPMEM should be configured as well

The following table describes capturing flows where data is captured from the sensor and sent to the memory without processing. This flows can be chained to the processing and display flows described on: Table 37-31, Table 37-32, Table 37-33 and on Table 37-34.

Table 37-30. IPU's capture flows

	Flow	Tasks chain	Physical DMA Channels		
			Video Input	Other Input	Output
	Capturing image from sensor and storing it in the memory (via SMFC) without processing	CSI0 or CSI1 --> SMFC --> MEM	---	---	IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3

Table continues on the next page...

Table 37-30. IPU's capture flows (continued)

	Flow	Tasks chain	Physical DMA Channels		
			Video Input	Other Input	Output
	Capturing image from sensor and storing it in the memory (via IC) without processing	CSI0 or CSI1 --> MEM	---	---	IDMAC_CH_5
	Capturing interlaced input and storing it in the memory (via VDIC) while performing video de-interlacing in the VDIC.	CSI0 or CSI1 -> VDIC --> MEM		IDMAC_CH_9 IDMAC_CH_10	IDMAC_CH_5 IDMAC_CH_13
		Interlaced input coming from one of the CSIs is sent to the memory without processing via channel #13. In addition 2 more inputs are read from the memory via channels 9 and 10. The processed image is written to the memory via ch 5 in progressive scan mode.			

NOTE

Register IPUx_SMFC_MAP is used to map CSI0 and CSI1 inputs to one of the four IDMAC channels. See Sensor Multi FIFO Controller (SMFC) for additional information.

The following table describe processing flows via the IC . This flows can start from the memory, can be chained to a capturing flow described on Table 37-30. The target of this flow can be chained to the display flows described on Table 37-32 and on Table 37-33.

Table 37-31. IPU's Processing flows

	Flow	Tasks chain	Physical DMA Channels		
			Video Input	Other Input	Output
	Preprocessing image from sensor for encoding	CSI0 or CSI1 --> SMFC --> MEM	---	---	IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3
		MEM --> IC (PRP ENC) --> MEM	IDMAC_CH_12	---	IDMAC_CH_20
	Preprocessing image from memory for encoding	MEM --> IC (PRP ENC) --> MEM	IDMAC_CH_12	---	IDMAC_CH_20
	Preprocessing image from sensor for encoding	CSI0 or CSI1 --> IC (PRP ENC) --> MEM	---	---	IDMAC_CH_20
	Preprocessing + rotation of image from sensor for encoding	CSI0 or CSI1 -->SMFC --> MEM	---	---	IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3

	Asynchronous display refresh via DC	MEM --> DC	IDMAC_CH_28	IDMAC_CH_42(command)	---
		Comment: IDMAC_CH_42 can be optionally used as command channel associated with IDMAC_CH_28			
	Asynchronous display refresh via DC	MEM --> DC	IDMAC_CH_41	IDMAC_CH_43(command)	---
		Comment: IDMAC_CH_43 can be optionally used as command channel associated with IDMAC_CH_41			
	Asynchronous display refresh via DP	MEM --> DP ASYNC	IDMAC_CH_24	IDMAC_CH_42(command)	---
		Comment: IDMAC_CH_42 can be optionally used as command channel associated with IDMAC_CH_24			

Table continues on the next page...

Table 37-33. IPU Asynchronous display flows (continued)

	Flow	Tasks chain	Physical DMA Channels		
			Video Input	Other Input	Output
	Asynchronous display refresh via DP	MEM --> DC	IDMAC_CH_24	IDMAC_CH_43 (command)	---
		Comment: IDMAC_CH_43 can be optionally used as command channel associated with IDMAC_CH_24			
	Reading data from asynchronous display	DC --> MEM	---	---	IDMAC_CH_40

The table below describes direct flows via the IC. These are processing flows via the IC where the output is sent directly to the DMFC. Direct camera to display flow is possible when the frame rate of the source and the destination is the same (typically the target display will be asynchronous display, where the display is updated at the rate of the source). From that point, any of the display flows described on Table 37-32 and on Table 37-33 can be chained.

Table 37-34. IPU direct flows to the display via the IC

	Flow	Tasks chain	Physical DMA Channels		
			Video Input	Other Input	Output
	Rotation and preprocessing of image from sensor for viewfinder and displaying it on synchronous display via DP	CSI0 or CSI1 --> SMFC --> MEM	---	---	IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3
		MEM --> IC (ROT VF) --> MEM	IDMAC_CH_46	---	IDMAC_CH_49
		MEM --> IC (PRP VF) --> DMFC	IDMAC_CH_12	IDMAC_CH_14	Direct to the DMFC
		MEM --> DP SYNC (BG/FG)	IDMAC_CH_23/ IDMAC_CH_27	IDMAC_CH_44 (mask)	---
	Rotation and preprocessing of image from sensor for viewfinder and displaying it on asynchronous display via DP	CSI0 or CSI1 --> SMFC --> MEM	---	---	IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3
		MEM --> IC (ROT VF) --> MEM	IDMAC_CH_46	---	IDMAC_CH_49
		MEM --> IC (PRP VF) --> DMFC	IDMAC_CH_12	IDMAC_CH_14	Direct to the DMFC
		MEM --> DP SYNC (BG/FG)	IDMAC_CH_24/ IDMAC_CH_29	command channel	---
	Preprocessing image from sensor for viewfinder and direct displaying it on asynchronous display	CSI0 or CSI1 --> SMFC --> MEM	---	---	IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3

Table continues on the next page...

Table 37-34. IPU direct flows to the display via the IC (continued)

	Flow	Tasks chain	Physical DMA Channels		
			Video Input	Other Input	Output
		MEM --> IC (PRP VF) --> DC	IDMAC_CH_12	IDMAC_CH_14	---
	Preprocessing image from sensor for viewfinder and direct displaying it on asynchronous display	CSI0 or CSI1 --> IC (PRP VF) --> DC	---	IDMAC_CH_14	IDMAC_CH_21
	Preprocessing image from sensor for viewfinder and direct displaying it on asynchronous display via DP	CSI0 or CSI1 --> IC (PRP VF) --> DP ASYNC	---	IDMAC_CH_14	IDMAC_CH_21
	Capturing interlaced input via CSI, then perform video de-interlacing in the VDIC. Then processing in the IC and direct displaying it on asynchronous display via DP	CSI0 or CSI1 -> VDIC --> IC (PRP VF) --> DP ASYNC	--	IDMAC_CH_9 IDMAC_CH_10 IDMAC_CH_14	IDMAC_CH_13 IDMAC_CH_21
		Interlaced input coming from one of the CSIs is sent to the memory without processing via channel #13. In addition 2 more inputs are read from the memory via channels 9 and 10. The processed image is sent to the IC for further processing then it is sent to the display			
	Capturing interlaced input via CSI, then perform video de-interlacing in the VDIC. Then processing in the IC and direct displaying it on asynchronous display	CSI0 or CSI1 -> VDIC --> IC (PRP VF) --> DC	--	IDMAC_CH_9 IDMAC_CH_10 IDMAC_CH_14	IDMAC_CH_13 IDMAC_CH_21
		Interlaced input coming from one of the CSIs is sent to the memory without processing via channel #13. In addition 2 more inputs are read from the memory via channels 9 and 10. The processed image is sent to the IC for further processing then it is sent to the display			

37.4.12.2.5 Sub-Frame Double-Buffering (Band Mode)

Page-flip double buffering is performed using full-frame buffers.

In addition IPU supports also page-flip double buffering using smaller buffers, each containing 4/8/16/32/64/128/256 rows of pixels. This allows the use of internal memory for buffering.

This mode can be supported by the following modifications (relative to full-frame buffers):

The address in system memory is generated by the same formula, but inserting the full row number, only k LSB's (for a band of 2^k rows) are inserted (e.g. [2:0] for 8 rows).

Page flip is triggered at the end of each band (when the k LSB's are all 1) and not only at the end of the frame. This flip may be accompanied by an ARM/SDMA interrupt, if synchronization with other modules (e.g. VPU or ARM) is needed.

The channels that can work in this mode are controlled by the corresponding IDMAC_BNDM_EN_<i>

bit. The BNDM parameter of the corresponding IDMAC channel has to be set as well.

37.4.12.2.6 Automatic Window Refresh

By programming the <>_SRC_SEL bits of the corresponding flow to autoref mode, automatic refresh of a window on the smart display is enabled. This means that the flow is triggered any time the refresh counter completes its counting. The refresh period is defined via the AUTOREF_PER field (the time unit is 2^{17} periods of the HSP_CLK clock).

The actual value of refresh period is equal to:

$T_{HSP}*2^{17}$ *(AUTO_REF_PER+1).

37.4.12.2.7 IPU VDOA synchronization

IPU can interact to a companion block called VDOA.

VDOA (Video Data Order Adapter) is used to re-order video data from the "tiled" order used by the VPU to the conventional raster-scan order needed by the IPU.

The VDOA can transfer its output to the IPU through internal memory, containing a band double buffer.

This tight double-buffering synchronization is performed without MCU involvement, using dedicated signals between the VDOA and IPU and the same protocol as used between two IPU DMA channels.

VDOA notifies the IPU which is the current band to read. IPU notifies the VDOA when the current band is read.

This synchronization is supported for VDI and IC(PP). The target destination of the VDOA data is defined by VDOA_DEST_SEL parameter. The PP_SRC_SEL or VDI_SRC_SEL has to be programmed as well to select VDOA as the source of the task.

For more details about IDMAC's band mode support Sub-Frame Double-Buffering (Band Mode).

The IPU settings and the VDOA settings has to be the same. In particular

- The band height defined at the IPU and at the VDOA must match
- The Number of Frames used by the VDI as defined by the VDI_MOT_SEL has to match the VDOA settings.

37.4.12.3 Interrupt Generator

The IG produces two interrupts to the ARM platform - the functional interrupt and the error interrupt. All of the interrupts are maskable.

The following table describes the functional interrupts.

Table 37-35. Functional Interrupts Summary

The table below describes the error interrupts. The panic column indicates if this signal is part of the logic generating the ipu_panic signal. The ipu_panic signal can be used for indicating about errors that are result of data rate problems. Such problems may be a result of the IPU running in slower clock then required by the use case. This signal can be used in order to indicate the system that the IPU can't handle the desired data rate. In that case the system may need to increase the clock to the IPU or simplify the use case.

Table 37-36. Error Interrupts Summary (continued)

37.4.12.4 SDMA event generator

The IPU provides an SDMA event signal that can be used as trigger to the SoC's SDMA. IPU routes an internal event to the SDMA event signal. The internal event causing the assertion of the SDMA signal is enabled by setting the corresponding bit on the SDMA_EVENT_# registers.

The user is allowed to enable multiple events. When one of these events occurs the ipu_sdma_event signal will be asserted. Similar to interrupts, the ipu_sdma_event signal is cleared by writing one to the corresponding bit in the INT_STAT_# registers.

It is not recommended to use the same internal event for a simultaneous generation of an interrupt signal and an SDMA event. This will require special software care when clearing the corresponding bit in the INT_STAT_# registers.

37.4.12.5 General Configuration Registers

The GCR contains a set of control/status/data registers. It provides IPU interface to the AHB slave bus.

The HCLK rate is equal to the HSP_CLK rate. The detail description of the registers is found in the Programmable Registers section.

37.4.12.6 Shadow Registers Module (SRM)

IPU supports frame by frame task switching. This means that a sub-block can handle a frame with one configuration and handle the following frame with different configuration. Changing the configuration is done by updating the sub-block's parameters.

In order to allow automatic flow without a need of the SW to update all the parameters at the frame boundaries. A Register of a sub-block that has the shadowing capabilities has a shadow register file that resides in the Shadow Register Memory.

The sub-blocks supporting this function may use it in one of the following ways:

37.4.12.6.1 Switching between 2 flows

Upon request from the FSU the SRM switches between the registers and the content in the Shadow Register Memory. When a sub-block uses one of the configuration SW, it is allowed to update the parameters in the memory. This is normally used when 2 flows are supported via one module.

- The current flow's configuration is stored in the module's registers
- The alternate flow configuration is stored in the SRM.
- When switching between flows the current flow's configuration is stored in the SRM. The alternate flow's configuration is written to the module's registers. When the alternate flow ends the configurations are swapped again.

This process is fully controlled by the FSU

37.4.12.6.2 Updating parameters between frames

This mode is used when the user needs to update the parameters of the current task being processed by the module. The updates can't affect the frame that is currently being processed. The update is effective only on the next frame. The SRM performs the parameters update only when there's a specific request by the user.

- The current frame's configuration is stored in the sub-block's registers
- The next frame's configuration is stored in the SRM.
- On frame's boundary the SRM reads the new configuration from the SRM and writes it to the sub-block's registers. The old configuration is lost.

37.4.12.6.3 Updating the memory

In order to avoid data coherency problems, the user should set a flag indicating that he is currently updating the memory region of a specific sub-block. When the flag is set the SRM will not attempt to replace the parameters relevant to the specific sub-block currently being updated by the user.

The user should clear this flag when he completes the update, and the parameters are ready to be used.

The flag is the corresponding **SRM_MODE** field for each sub-block. This field controls the SRM logic that handles the sub-blocks registers

- 00 - ARM platform is allowed to access the sub-block's region in the RAM; The automatic swapping mechanism is disabled.
- 01 - The SRM logic is controlled by the FSU. The update will be done of the next frame.
- 10 - The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame
- 11 - Update now. The SRM is controlled by the ARM platform. The Register will be update now

Each sub-block uses the SRM mechanism according to the sub-block's behavior, the table below summarizes the SRM support for each sub-block

Table 37-37. SRM support per Sub-block

Sub-block	Switching between 2 flows support	Updating parameters between frames	Comment
CSI1, CSI0	NO	YES	SRM_MODE can be 00 or 01. The update will happen only once. When set to 01: after the update the state machine is automatically moved to 00 mode. It is recommended to make sure that the first frame has started by polling the corresponding NFACK bit before setting the SRM_MODE
DI1, DI0	NO	YES	DI0, DI1 parameters are needed when clock change is performed (Clock Change procedure). SRM_MODE can be 00 or 01. The update will happen only once. When set to 01: after the update the state machine is automatically moved to 00 mode
DC	YES	NO	SRM_MODE can be 00 or 10.
DP	YES	NO	SRM_MODE can be 00, 10 or 11. When set to 11: after the update the state machine is automatically moved to 10 mode

Table 37-37. SRM support per Sub-block

Sub-block	Switching between 2 flows support	Updating parameters between frames	Comment
			10 is not supported for SYNC flows

In order to update parameters the user should monitor the SRM_BUSY bit of the corresponding sub-block. When the SRM is not busy the user should set the **SRM_MODE to 00. The user will now update the register file in the memory. When done the user should switch the SRM_MODE field to the desired mode.**

37.4.12.6.4 SRM priority

The SRM updates the registers according to a pre defined priority. The priority is set according to the SRM_PRI bits of each sub-block. The user must set a unique value for each sub-block.

37.4.12.6.5 SRM entries mapping

The table below maps any IPU register to an address in the SRM. The registers marked as NONE do not have an SRM entry

PG column indicates if this register is saved during power gating mode

LPSR column indicates if this register is swapped during low power screen refresh mode (LPSR)

Table 37-38. IPU SRM entries mapping

37.4.12.7 Memory Access Unit

The Memory Access Unit (MA) supports ARM platform access to the IPU internal memories.

Some of the IPU internal memories are memory mapped. This unit handles accessing these memories. The table below describe the accessible memories and their limitations.

Table 37-39. Internal Memories Access Support and Limitations

Memory	Function	Support and Limitations
lut	IDMAC's look up table	Accessible only when All the IDMAC channels that use the LUT are disabled
cpmem	IDMAC's Channel parameter Memory	This memory can be accessed while tasks are enabled. Must be configured before enabling processing tasks.

Table continues on the next page...

Table 37-39. Internal Memories Access Support and Limitations (continued)

Memory	Function	Support and Limitations
		IDMAC channel parameters must not be changed in the CPM when the corresponding DMA channel is enabled excluding the base addresses (EBA0 and EBA1). One of these parameters can be changed during channel operation if it relates to the non-active double buffer.
tpm	IC's task parameter memory	Must be configured before enabling processing tasks. This memory can be accessed while tasks are enabled. IC task parameters must not be changed in the TPM when the corresponding task is active.
dc_template	DC's template memory	Can be configured before enabling tasks. Must not be accessed while operation. Both read and write access to the DC's template memory are forbidden when there is any enabled channel which can use the template

37.4.12.8 SISG - Still Image Synchronization Generator

The IPU incudes a "Still Image Synchronization Generator" (SISG), providing time-sensitive control signals synchronizing the image sensor with camera peripherals, such as a flash lamp and a mechanical shutter.

The SISG is implemented using a single time base counter, and six Time Compare Units - as described in the following figure.

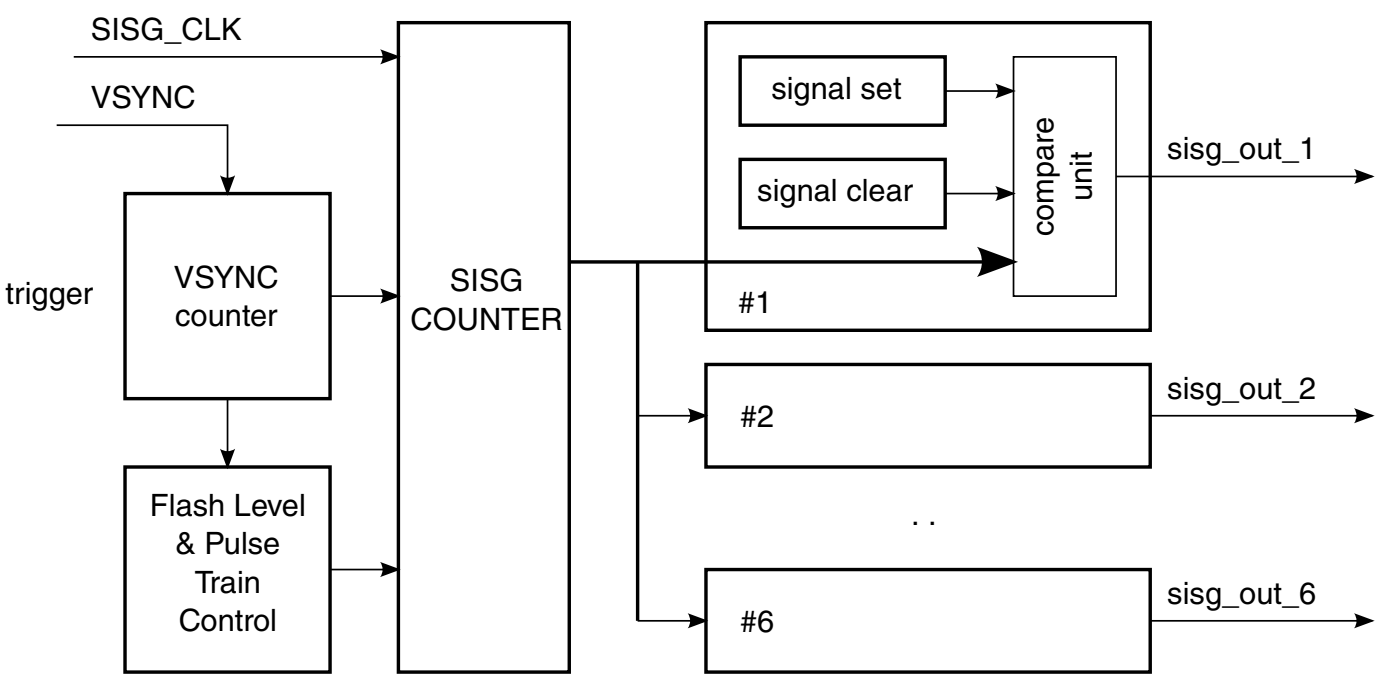

Figure 37-54. Still Image Signal Generator

The SISG inputs are:

- Activation trigger
- VSYNC: the frame-boundary signal from the sensor

The SISG is activated by one of the following triggers:

- The ARM platform by setting the MCU_ACTV_TRIG bit
- A signal generated by an appropriate short packet received through the MIPI/CSI-2 I/F
- An external signal (GPIO pin)

Upon activation, the counter is reset and then there are the following two possibilities:

- Counting starts immediately
- Counting start is delayed until one of the next 7 VSYNC signals (programmable via the NO_OF_VSYNC bits)

During the counting period, the SISG can generate up to 6 output strobes:

- Each strobe can be individually enabled or disabled and has a programmable polarity
- The edges of the strobes are generated at specified counter values - to achieve pixel-level resolution - as specified by programmable SISG_SET& SISG_CLR time tag registers
- The clock has 25 bits, to allow strobe generation during a time period of up to two 12M pixel frames

The SISG can repeat the above sequence for up to 32 cycles (this is provided to generate a train of flash pulses, for anti-red-eye or for measurements in low-light conditions). The repetition is implemented by resetting the counter, which can be triggered by one of the following events:

- A VSYNC signal
- A pre-defined value reached by the counter

After the last sequence, when the counter reaches its maximal value, it stops counting and the SISG remains in idle mode until the next activation.

37.4.12.9 Clock Change procedure

The IPU supports dynamic clock rate changes.

Types of change:

- DVFS transitions: frequent, initiated by the SoC's power modes controller (GPC) and the SoC's clock controller module (CCM)
- Other: infrequent, initiated by SW.

IPU may have on-going activities at this stage.

The display interface clocks may either change or remain unchanged. During screen refresh, the display clock would typically not change. During asynchronous access, it may be appropriate to change also the display interface clock. The choice between these options would be made in advance by the user

If the IPU display interface uses the external clock (DI0_DISP_CLK - ipp_di_0_ext_clk or DI1_DISP_CLK - ipp_di_1_ext_clk) source, it remains unchanged. A change in the rate of this clock is performed fully by SW, without the special HW support described below. In particular, the SW may have to stop explicitly any interaction with the display (e.g. screen refresh) before performing the change.

The user is responsible to make sure that the lowest planned clock (in DVFS transitions) is still high enough to support the expected activities (e.g. data rate through the display bus)

The procedure below describes the IPU handshaking with the CCM.

1. The user prepares 2 sets of clock modes CLOCK_MODE_0 is the default clock mode, CLOCK_MODE_1 is the alternate clock mode. The IPU toggles between these two settings following the next assertion of ipg_clk_change_rq. If the user sets the SRM_CLOCK_CHANGE_MODE bit then he should also prepare the registers in the SRM for each of the DIs. These registers include all the DI settings adjusted to the new clock.
2. CCM asserts the ipg_clk_change_rq signal when a clock change is needed
3. The CM calculates the new clock frequency and send it to the DI (signals are di0_clk_freq, and di1_clk_freq). These signals should be sent to the DI only after getting the di_clk_change_ack signal from the DIs. The values of this field could be.
    - 00 - 1/4 of full frequency
    - 01 - 1/2 of full frequency
    - 10 - full frequency
    - 11 - illegal
4. The CM sends a cm_clk_change_rq signal to the DIs.
5. The DI stops the clock to the display (freeze mode) according to DI0_CLOCK_STOP_MODE & DI1_CLOCK_STOP_MODE bits. If the DI is disable, the ACK from the DI is not needed and the CM will assume that the DI sent an ACK.
6. Once the clock to the display is stopped, the DI sends a signal to the CM called di_clk_change_ack
7. The CM wait for the clock change signals from both of the DIs
8. If the SRM_CLOCK_CHANGE_MODE bit is set the CM should read the new DI settings from the SRM and override the previous DI settings. Then the CM clears the SRM_CLOCK_CHANGE_MODE bit

9. Once the above is complete the CM asserts the ipg_clk_change_ack signal to the CCM
10. The CM sends the signals di0_clk_freq, and di1_clk_freq to the DIs.
11. The CCM will negate the cm_clk_change_rq
12. The CCM will now change the clocks
13. When the new clock arrives the ipu_clk_changed signal will be asserted.
14. The state machine on each DI will now move out of freeze mode and continue working with the new clock.

37.4.12.10 Low Power Modes

IPU supports the following low power modes.

- STOP: on this mode the clock to the IPU is stopped
- LPSR: low power screen refresh.The clock to the IPU is changed to a slower frequency, the IPU performs only screen refresh.

The user should not request LPSR. at the same time. This case is not supported and the results are not predictable.

The CCM may assert one of the 2 signals: stop_clk_at_stop_req OR stop_clk_at_wait_req

The IPU OR them internally as there's no difference between them with regards to IPU's behavior.

In all these modes the clock to the IPU is going to be stopped (assertion of stop_clk_at_stop_req).

IPU should complete all his tasks:

- CSIs complete transferring the last frame. Wait for csi_busy = 0
- IDMAC completes all the flows (all CH_BUSY = 0)
- All the flows in the FSU are complete. New ones do not start.
- CM sends stop request to the DIs
- Once the DI sent all the data to the display, it asserts an ACK signal

Only when all the above occurs, the CM can assert an internal signal called "IPU_IDLE"

IPU_IDLE is the starting point for any of the low power modes.

Note that if the VDIC was in use prior to entrance the low power mode the viewfinder task of the IC will be in WAIT_FOR_READY state (the task's status is reflected in the VF_TSTAT field). The user will need to manually switch that task to IDLE. This is done by performing the following steps:

- Wait for EOF of the viewfinder output channel (IDMAC_EOF_21)
- Set RSW_EN bit
- resume one frame via the viewfinder task.
- Disable the VDI and IC and the corresponding IDMAC channels

37.4.12.10.1 STOP Mode

In this mode the IPU sends the ipu_stby_ack after getting to IPU_IDLE state. The CCM will gate off the clock to the IPU.

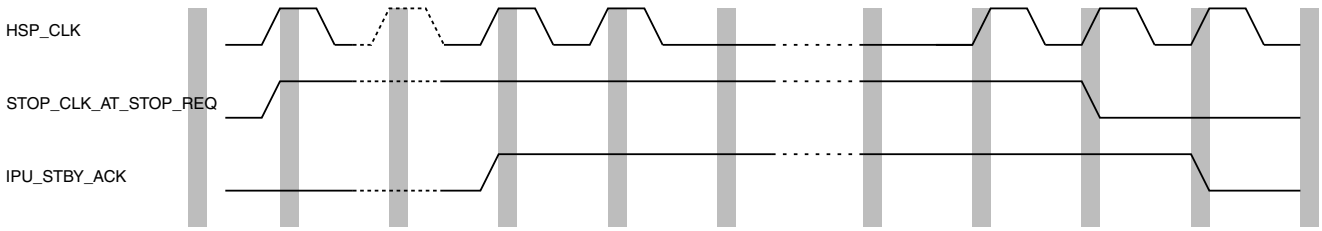

Figure 37-55. Entering and Exiting STOP Mode

Wake up from STOP mode

When the SoC decides to wake up from STOP mode it should:

- Resume the clock to the IPU.
- Negate the stop_clk_at_stop_req or stop_clk_at_wait_req signal.
- The IPU will then negate the ipu_stby_ack signal.
- The IPU will resume screen refresh.

37.4.12.10.2 Low Power Screen Refresh mode - LPSR

In Low Power Screen Refresh mode, the clock to the IPU is changed to a slower frequency, the IPU performs only screen refresh to a single display via the DP (channels 23 & 27).

Preparations

1. The user sets the LPSR_MODE bit indicating that the next assertion of stop_clk_at_stop_req OR stop_clk_at_wait_req activates the LPSR procedure.
2. The user moves the IPU to screen refresh flow. This means that if other tasks are active (flows via CSI or multiple flows to multiple displays) - this tasks needs to be complete and disabled. This is step is fully done by the user (SW). The only flow that remains active is screen refresh to a single display done via the DP (channels 23 & 27)

3. The user stores in the SRM the planned configuration for the sub-blocks involved in the LPSR flow. These configuration will e switched with the active registers' settings on later stage. The relevant sub-blocks are:
   - DI0 & DI1
   - DC
   - DP
   - DMFC
   - IDMAC
   - CM

Entering LPSR

The flow for entering LPSR is the same as stop mode.

1. The IPU follows the same procedure as on STOP mode till getting into IPU_IDLE state.
2. IPU swaps the registers of the relevant blocks with the pre stored content from the SRM. The content of the registers of the current flow is stored in the SRM. The IPU will switch back to this configuration after exiting from LPSR.
3. The IPU sends the ipu_stby_ack
4. The CCM will gate off the clock to the IPU.
5. The CCM will switch to the new clock
6. After changing the clock, the CCM asserts ccm_lpsr_ipu, this signal is synched inside the IPU to the hsp_clk
7. The IPU will resume screen refresh with the new settings.

Exit from LPSR

1. The CCM negates ccm_lpsr_ipu
2. The CM sends standby request to the DI
3. The DI should complete processing the current frame and stop the clock to the display and send an acknowledge signal to the CM.
4. The SRM swaps the registers' configuration. current configuration (LPSR) is saved in the SRM, the previous (original) configuration is stored in the blocks' registers.
5. IPU asserts the ipu_wakeup_ack signal indicating that it is now safe to leave LPSR mode.
6. CCM stops the clocks to IPU
7. CCM resumes the clock to the IPU - This clock is the same clock used prior to entering the LPSR mode.
8. CCM negates the stop_clk_at_stop_req (or stop_clk_at_wait_req)
9. IPU negates the ipu_stby_ack and the ipu_wakeup_ack signals
10. The IPU resumes screen refresh with the original settings.

The diagram below illustrates the procedure for entering and leaving LPSR mode

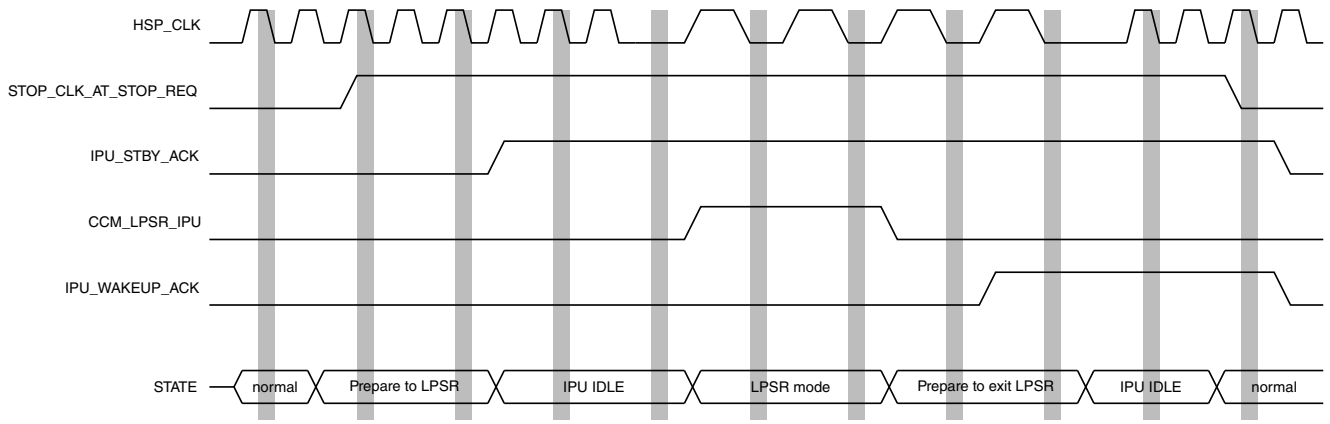

Figure 37-56. Entering and Exiting LPSR mode

37.5 IPU Memory Map/Register Definition

The address space for accesses through the AHB-lite slave port is 4 MB and it is split internally (with 2MB resolution) according to bit [21] of the address. Using the following notation

Address = (IPU_ID[31:25], 1,1,1,MSB[21], LSB[20:0])

the address is used as follows :

1. MSB=0: Low-level access to an external device, with LSB[3:0] = (Lock, CS, RS[1:0])

- LSB[5:4] = RS[1:0] (the address on the display interface)
- LSB[6] = Choice of display's channel (0=channel 8, 1=channel 9)
- LSB[7] = Lock (Lock=1 prevents the use of the display port until the next ARM platform access)

1. MSB=1: access to internal IPU registers, with address LSB

NOTE

The addresses given in the table are relative to the IPU base address defined at SoC's level.
